In England, during the later middle ages, not only did every borough possess a market, but also the lords of most considerable and of many inconsiderable villages; and the right to demand toll thereat was a valuable franchise. From an early date the right to establish a market was held to belong exclusively to the crown; and no market could be defended in the courts save upon the ground of such a grant or of immemorial prescription. In the 10th century an attempt seems to have been made by repeated decrees of the witan to limit all sales to "ports" or market-towns, a measure closely connected with the insistence upon the witness of "credible" men to every transaction. But this policy was either defeated or abandoned, for the number of markets in the rural manors evidently began to increase about this time. The Domesday Survey records some fifty markets or fraction of markets (*i.e.* rights to receive fractions of the profits), and it registers many complaints as to the setting up of markets without authority and the exaction of undue tolls. The pecuniary advantages derived from the possession of a market were, however, so large that every considerable magnate sought to obtain a grant from the crown, and many did not scruple to set up markets without waiting for permission. The chief obstacle to their success lay in the vested interests of markets already established. Before making a grant it was usual to inquire, on a writ *ad quod damnum*, whether it would be prejudicial to existing rights. When a market was established without a grant some neighbouring lord or borough was pretty sure to bring a suit against the new rival on account of the "nuisance" or "damage" he occasioned. The rule laid down by Bracton is that a market becomes a nuisance if set up within six miles and two-thirds of one already existing, on the ground that sellers could travel on foot that distance, sell their wares, and return within the compass of a day. The illegal assumption of market rights was probably put an end to by the *Quo Warranto* inquiries of Edward I. Grants of market privileges were made in the 13th century in more than 3000 instances, in the 14th in more than 1500. By that time the country was pretty well supplied with such facilities for trade; so that in the first 82 years of the 15th century only some 100 grants are to be found. By the first statute of Westminster (3 Ed. I. c. 31), the king was empowered to take into his own hand the franchises of markets where outrageous tolls were demanded. Markets were commonly held during the earlier centuries in churchyards and on Sundays. The former custom was prohibited by the statute of Winchester (13 Ed. I.); the latter was abandoned in many places early in the 13th century, as a result of the moving sermons of Eustace de Flay, and was finally prohibited by 27 Henry VI. c. 5. It was in the markets and by the market officers that the men of the middle ages sought to introduce and maintain their simple-minded ideals of trade. All the rules with regard to Forestalling (see FORESTALLERS AND REGRATORS) aimed at bringing consumer and producer as nearly as possible face to face in the open market. Yet while restrictive in some respects, in others market intercourse led to a relaxation of previous restraints. Thus during the period of the dominance of the merchant gild it was common to suspend on market days, in whole or in part, the regulations limiting freedom of trade on the part of non-members. And the same tendency is illustrated by the growth in England and abroad of the rule of MARKET OVERT, by which a *bona fide* sale, made on the market day and at the place assigned for the market, transfers the legal property of the thing sold to the vendee, so that his title is good against all save the king, however defective that of the vendor may be (see also MANOR).

[The English material for the history of fairs and markets is conveniently brought together in the Report by Messrs. Elton and Costelloe for the *Royal Commission on Market Rights*, vol. i. (1889). It has a large appendix of documents, a calendar of grants from 1 John to 22 Ed. IV., lists of fairs in 1792 and 1888, and a list of general and local acts of parliament. See also the chapter on "The Town Market" in Mrs. Green's *Town Life*, vol. ii. (1894). In many English and continental towns a stone cross was erected in the centre of the market place in the later middle ages. For a description of the farmers' wives and daughters sitting with their butter and eggs on the steps of the cross "until a certain hour in the afternoon, after which, if all their goods were not disposed of, they took them unwillingly to the shops and sold them at a lower price," see Mrs. Gaskell's novel of *Sylvia's Lovers*, ch. ii. These market-crosses were often "polygonal buildings with an open archway on each of the sides, and vaulted within, large enough to afford shelter to a considerable number of persons; of these good examples remain at Malmesbury, Salisbury, Chichester, Glastonbury, etc." (Parker, *Concise Glossary of Architecture, s.v.* "Cross"). In more

recent times market halls have been generally erected by municipalities, though the market women can by no means always be induced to pay for the privilege of shelter.

There has of late been an animated discussion among German scholars as to the part played by the market in the growth of the municipal constitution. A summary of the evidence and arguments on one side will be found in L. Goldschmidt, *Universalgeschichte des Handelsrechts* (vol. i. of his *Handbuch des H.*, 1891), pp. 126 *seq.*, who goes so far as to say "The town tribunal is originally and essentially the market tribunal, the town itself a market, the town peace a market peace." For the keenest criticism of this view, see G. von Below, *Der Ursprung der deutschen Stadtverfassung* (1892).] W. J. A.

MARKET (on the stock exchange). The stock exchange is a remarkable case of development of the original meaning of a "market." Within the stock exchange the consol market, the home railway market, the foreign stock market, the American market, the miscellaneous market, the mining market, with its off-shoot the "Kaffir" market for South African shares, —each is spoken of as an assemblage of dealers standing ready to buy or sell the various stocks and shares indicated by the titles of their respective markets. Outside the stock exchange a market is not so regarded. A person wishing to buy or sell sends in his broker to inquire as to "the state of the market" in consols, or American shares, or mining shares, as the case may be. The broker goes to the dealers, knowing exactly where to find his men, and gets their quotations of price and tendency, and, what is important, he has the opportunity to examine the prices "marked"—on a board provided for the purpose—at which previous business had been done. Thus it is possible to get at once the record of price and the personal opinions of competitive dealers, both being elements of a market. Further, the quotations of price which the dealer gives are not simply an expression of opinion; if he quotes a price for a given amount of stock or quantity of shares, he must deal. For example, if the dealer quotes 90 to 90¼ for a specified quantity of Italian bonds of £100 each, he must take them at £90, or sell them at £90 : 5s. Nothing could be a more definite quotation, a more exact reflection of the actual state of the market. There is little possibility of picking up stock cheaply, as a connoisseur could pick up a fine old Italian violin from some ignorant villager; on the other hand, there is little risk of fraud upon an ignorant seller. The member of the stock exchange who attempted to cheat an outside seller, or his broker, would be subject to the severest censure from the committee for general purposes (see Exchange, Stock), and would be sent to Coventry by the more scrupulous of his colleagues. Nothing, then, could be a more complete instance of a market than is given by the stock exchange. We get records or markings, the opinion of a concourse of dealers, competition, and a check upon dishonest dealing.

[For defin. of market, Jevons's *Theory of Pol. Econ.*, ch. iv.; *Theory of Exchange*. Also Cournot, *Recherches, etc.*, 1838, p. 55 n.—Giffen, *Stock Ex. Speculation*. See Art. Higgling of the Market.] A. E.

MARKET OVERT. The law of market overt constitutes a fitful and illogical application to English law of the French maxim "en fait de meubles, possession vaut titre." The general rule in England is that no one by transferring goods to another can give a better title than he himself possesses. But when a person in good faith buys goods in "open market" and according to the usages of the market, he acquires a good title to them, in spite of any want of title in the seller. The rule only applies to ancient, and not to modern statutory markets. All sales by shopkeepers in the city of London, when the goods themselves are in the shop, are by custom sales in market overt, but the custom does not extend beyond the city limits. Hence if a stolen watch be sold in Fleet Street, the buyer may get a good title to it, while he gets no title to it if he buys it in the Strand. Wholesale mercantile transactions, it may be noted, are to a great extent protected by the Factors Act, 1889.

MARKKA (Finland). The metallic currency of Finland consists of the following coins (imperial decree of 8th November 1865):

Denomination.	Weight grammes.	Millesimal Fineness.	Intrinsic Value.	
			English Standard. Gold: £3:17:10½ per oz., 916·6 fine. Silver: 5s. 6d. per oz., 925 fine.	French Standard. Gold francs, 900 fine. Silver francs, 900 fine.
Gold—			s. d.	francs.
20 markka	6·452	900	15 : 10½	20
10 "	3·226	900	7 : 11·125	10
Silver—				
2 markka	10·865	868	1 : 8½	1·99
markka	5·182	868	10½	·99
50 penni[1]	2·549	750	4½	·42
25 "	1·274	750	2	·21

There are also bronze coins of the nominal value of 10, 5, and 1 penni.

The standard gold markka (not a coin) is the

[1] The piece of money which, reckoned in French standard silver francs, is only worth ·42 franc, is in reality a token coin passing as the half of a *gold* standard markka.

equivalent of the gold franc, that is to say, about 9½d., or 25·22=£1, the penni being of the same nominal value therefore as the French centime. F. E. A.

MARLO, KARL. This was the pseudonym under which Karl Georg WINKELBLECH (1810-1865) published his economic writings. Winkelblech was born at Ensheim, near Mainz, studied physics and chemistry at Giessen—the latter under Liebig—became *privat-docent* at Marburg in 1837, and in 1843 was appointed professor of chemistry in the higher trade-school at Cassel. In early life he showed strong literary tastes, carrying about with him habitually a volume of Goethe, Schiller, or Lessing. The impulse which made him an economist came from a German workman whom he met during a journey in Sweden undertaken for technical objects. This casual companion drew so vivid a picture of the sufferings of the class to which he belonged that Winkelblech resolved to devote for the future his most earnest studies to the condition of the workers, rather than, as previously, to the instruments and processes of industry.

His principal work, which remained unfinished at his death, is *Untersuchungen über die Organisation der Arbeit, oder System der Weltökonomie*, 3 vols., 1850-59. It produced little effect in Germany, perhaps—as Lippert suggests—in consequence of the social discouragement and apathy then prevailing. It was highly praised by Schäffle in his *Kapitalismus und Socialismus* (1870), and the attention thus drawn to it led to the publication, in 1884-86, of a posthumous second edition, enlarged and containing a biographical sketch of the author.

The book opens with a history and criticism of the progressive life of the most important civilised nations—France, England, the United States of America, and Germany, and a study of their comparative ripeness for what he regards as a necessary transformation of the basis on which their economic systems rest. The tendency of modern changes in the industrial sphere had been to abolish the smaller capitalists, and to create a great mass of *prolétaires*, who can never hope to attain social independence, and whose wages will never suffice for much more than to sustain their lives. Employment, too, has become uncertain, and the increased division of labour has made work monotonous and uninteresting. The working classes do not enjoy any true domestic life; wives and mothers spend their days in factories, and cannot superintend their families; and morality suffers from the employment of the younger women in manufactures. The physical condition of these classes is deplorable, their dwellings are overcrowded, their food is insufficient, and drunkenness, improvidence, and a spirit of revolt are the necessary results of their entire position. The modern *prolétaire* is the successor of the ancient slave and the mediæval serf; and it may be doubted whether he is more advantageously situated than those who had at least an assured existence. This is, it will be seen, the picture habitually drawn by the socialists, in which the dark side of our industrial life alone appears. But it is real enough in many of its features to make us ask anxiously for the remedies which the author suggests.

According to his view of economic history, there have successively prevailed two different ideas of right, which he calls the Pagan and the Christian respectively. Under the reign of the former it was regarded as natural and legitimate that the masses should be sacrificed to ensure enjoyment and splendour to the few; whilst the Christian idea asserts the equality of all, and requires that each member of the community should have a share of the produce of the social labour proportional to his useful participation in the work. The former principle, to which he gives the name of *Monopolismus*, is represented by ancient slavery,—and its later modifications, serfdom and forced labour,—and continued to reign down to the French Revolution. The Christian principle, though accepted by the general conscience, has as yet only partially influenced practice; privileges, monopolies, and gambling speculation still exist, sometimes in aggravated forms. Two efforts have been made to realise the new principle—Liberalism, aiming at universal liberty, and Communism, aspiring after a *régime* of equality. But both these systems are one-sided and erroneous. Liberalism, based on the merely negative idea of unlimited competition, after demolishing the old privileges, has become the parent of plutocracy, whilst communism, distributing products according to wants, not services, and so weakening the motives to exertion, would infallibly beget indolence. These opposing systems he sought to reconcile, and to unite true liberty with true equality by the establishment of a *panpolismus*, the aim of which would be to raise to the highest attainable level the self-development and legitimate life-enjoyment of all the members of the community. Under this *régime* the obligation to labour will be universal, every one will have a right of access to the means of production, and will be supplied with work, and each will obtain for his personal use the entire amount of his contribution to the common stock. The state will take into its hands not only railways and roads, postal communication, water-supply, banks, and educational institutions, but also forestry, mining, fisheries, and trade—so far as it has to do with such raw products or manufactures as are fitted for exhibition and sale in warehouses. Under private management will be agriculture, cattle-rearing, and trade and transport in the narrower sense; but these occupations will be carried on not by independent speculators, but by guilds or industrial societies (*Zünfte*), organised by the state. Existing capitals in the possession of individuals at the instalment of the new system will not be interfered with; but its operation will prevent their subsequent increase. The instruments of production will be common property, but the instruments of enjoyment—the fruits of industry—will be the property of individuals. Foreign competition will be limited by protective duties. Winkelblech admits that his own, like every other social plan, must fail, if provision is not made against an undue multiplication of the workers. "Whoever," he says, "promises to the people to

rescue them from wretchedness without setting himself against over-population, excites expectation which can never be realised, and should be looked upon as a dangerous demagogue." Adopting the theory of MALTHUS, Winkelblech regards the practical safeguards proposed by its author as altogether insufficient. Agreeing with him in advocating the suppression of a state provision for the destitute, he would go farther, and would enforce by law the abstinence from marriage in certain cases, which his predecessor only contemplated recommending as a moral duty. He would make it obligatory upon every member of his societary system to contribute to an assurance fund against the consequences of age, sickness, or misfortune, and for the maintenance of the widow and orphans he might leave at his death. No one should be permitted to marry until he could show that he had sufficient means to guarantee his payments to such a fund, and additions should be made to this "marriage capital" according to the number of his children. Such individual cases of distress as might continue to exist under the new order of things would be left to be dealt with by private beneficence.

ROSCHER speaks of Winkelblech as one of the most solid (*gründlich*), moderate, and conscientious of the socialists, and he appears to deserve that description. He took no part in political agitation, but maintained throughout the attitude of a thinker. His denunciations of the existing economic system were dictated, not by class-hatred but by genuine sympathy with the working people. But he expected too much from his new social order, even if it were possible to establish it. As Cossa remarks, whilst he saw clearly the difficulties which every form of socialism has to encounter in its almost certain results of insufficient production, excessive consumption, and the stimulus to an indefinite increase of population, he had at the same time a very undue degree of confidence in the precautions he suggests against those dangers.

[Lippert in *Handw. der Staatswissenschaften.*—Roscher, *Gesch. der N. O.*, p. 1021—Cossa, *Introd. to the Study of P. E.*, p. 539.—Rae, *Contemporary Socialism*, ch. ii.—W. H. Dawson, *German Socialism*, p. 48.] J. K. I.

MARMONTEL, JEAN FRANÇOIS (1723-1799), a distinguished 18th-century prose and verse writer.

Voltaire encouraged him to produce plays for the stage, and by the favour of Madame de Pompadour, he was appointed clerk of public buildings. In 1763 he entered the Academy, to which he became Perpetual Secretary. He was a member both of the electoral assembly of 1789 and of 1797, but was degraded for his moderation. His connection with political economy lies mainly but not entirely in the fact of the emotional interest the perusal of his *Mémoires* excited in the mind of J. S. Mill, at a very critical stage of that writer's career. His *Mémoires* have allusions to QUESNAY and other matter of economic interest.

[Mill's *Autobiography*, p. 140, ascribing to the experiences of this period "marked effects on my opinions and character"; also see Cossa, *Introd. to the Study of Pol. Econ.*, translated by L. Dyer, London, 1893, p. 331.—Marmontel's *Works* in 32 volumes, were published in 1787, 8vo.] A. L.

MAROGNA, CONTE GIAN GIUSEPPE (18th century), born in Verona; wrote on trade corporations for the prize competition offered for this subject by the academy of Verona, 1789 (see MARACHIO).

Marogna holds an intermediate place between the advocates of free labour and the supporters of old restrictions; he shows the disadvantages of some of the trade corporations, and suggests their partial abolition. Desiring to promote the improvement of manufactures, he suggested the uniting in trade corporations only those crafts which required skill and intelligence, leaving the rest free, and suppressing the corporations of merchants and dealers. For these latter, rather than for those of artizans, he fears the injurious effect of monopoly. Though Marogna advocates abolishing the corporations of merchants, he does not support free trade, but, on the contrary, recommends state interference in determining prices.

Sul governo delle arti-ragionamento, Verona, Moroni, 1792. [G. Alberti, *Le corporazioni d'arti e mestieri, e la libertà del commercio negli antichi economisti italiani*, Milan, 1889.] U. R.

MARPERGER, PAUL JACOB (1656-1730), was originally a merchant, before he entered the Danish and the Prussian civil services. At the time of his death he was an aulic and commercial councillor in Dresden.

Until the middle of the 18th century Marperger enjoyed a great reputation in Germany as being "perhaps the most distinguished supporter of cameralistic science," and "almost the only German author on trade." He was an inexhaustible writer on commercial subjects; his book on Banks (1716) is best known. Roscher is very severe on Marperger, and considers him as having simply diluted anterior publications and added to them some very trite moral sentiments (*Gesch. der. Nat. Oek.*, pp. 301-302). E. CA.

MARQUE, LETTERS OF. This term is derived from the mediæval Latin word *marcha*, a frontier, a letter of marque being a licence granted by a sovereign to a subject who has sustained wrong and been denied justice in a foreign state, to cross the frontiers and execute reprisals, that is, recover his property or seize an equivalent by way of compensation. Hence the full phrase is "letters of marque and reprisal." The fundamental idea, which was borrowed from the Roman law, was that nations formed a *societas* or partnership, with the customary incident of unlimited mutual liability. So far as the individuals were concerned upon whom such reprisals were taken, it was argued by the mediæval civilians that they could obtain indemnity from their countrymen, members of the same "societas"; whilst between them and the foreigner no such tie existed. Letters of marque

were granted by John and Edward III. The earliest case mentioned by Ducange is in a charter granted by James, king of Aragon, in 1326. In the black book of the Admiralty, I. 385, is a complaint laid by a merchant of Danzig in 1409 against Henry IV.'s step-son, John, Duke of Brittany, and his subjects for the plunder of his ship. He was granted letters patent to seize Breton ships and goods in Irish waters to the amount of his loss, "nomine distruccionis vocate marquæ." The peculiarity of this case is that the grantee was an alien who claimed as being in amity with England. In 1416 a statute was passed reciting the wrongs and injuries sustained by English subjects at sea, and empowering the lord chancellor, where justice was denied to letters of request, to grant letters of marque (4 Hen. V. st. 2, c. 7). Such letters were not regarded as a breach of the peace. They were issued not only on behalf of individuals but of particular towns, as in 1487 by the emperor on behalf of Cologne against Scotland (Macph. I. 707). The feeling grew up in the 15th century that they were incompatible with treaties of peace, and Henry VII. remonstrated at their issue against the English by Ferdinand and Isabella in 1488. (*S. P.*, Sp. 17, p. 4; 21, p. 12; 34, p. 22, etc.). But numerous instances occur during the reign of Henry VIII. in which this practice continued. (*S. P.*, Dom. Hen. VIII. III. 2224. Acts Priv. Counc., I. 107, 108, etc.).

A limitation was, however, introduced into treaties, as into that between England and France on 7th August 1514, binding the sovereigns on either side only to issue "letters of reprisals, marque, or counter-marque" against principal delinquents and then only in case of denial of justice. (Rym. *Foed.* Hague ed. VI. i. 65). An example of such letters is given in Molloy, I. 46, dated 17 Car. II. Such letters of marque are now disused, and the term "letters of marque" is applied to commissions issued in time of war by the lords of the admiralty in conformity with various acts of parliament to owners of merchant vessels, called privateers, allowing them to capture ships of the enemy and to divide the prizes, which would otherwise belong to the crown. During the Crimean War the allied powers issued no letters of marque. By the Declaration of the Conference of Paris in 1856 privateering was abolished so far as the contracting powers were concerned. These were Great Britain, France, Austria, Russia, Prussia, Sardinia, and Turkey. Spain, Mexico, Venezuela, and the United States have refused assent to this agreement.

MARRIAGE (FEUDAL SYSTEM). The lords of tenants by knight's service had the right of bestowing in marriage their female wards while under age. This right, which was probably of gradual growth, makes its appearance as settled law about the 11th century. Its operation was soon extended, and a gift by the king, of a widow, in marriage, and her lands, is recorded in Domesday (Ellis, i. 337). It was required that the match should be, as Blackstone says, without "disparagement or inequality," and that the king's license should be given. This was to avoid marriages to the king's enemies. The right was afterwards extended to the case of male wards. If the infant refused to obey, he or she forfeited the value of the marriage, that is the sum actual or assessed which the guardian could have received for it. Marriage without the guardian's consent entailed a double forfeit. The right was only valuable in the case of the children of tenants by knight's service, for though, as Littleton states, it was in a sense also an incident of socage tenure, the *valor maritagii* did not in that case belong to the guardian—who was not an overlord, but was the person nearest of kin to the ward who was not in the line of inheritance. The MERCHET, or fine, for permission to manorial tenants of the villein class, and sometimes even to the freeholders, to marry was a minor source of revenue to the lord; but it was totally different in origin from the feudal right. Henry I. by his charter of 1101 declared the right abolished, but his decree was inoperative in this respect. It reveals incidentally that widows as well as children of the king's barons, and *homines* were, as stated above, liable to the oppression, and that the barons claimed the same right over their own tenants by knight's service. The *Rotuli de dominabus et pueris et puellis de donatione regis*, drawn up in the 31st year of Henry II., gives a list of widows, their ages, children, and lands, thus showing the system in full operation. A special condition as to heirs, and the abolition of the right over widows, was granted by Magna Charta, but the sale of wards is recognised by the statute of Merton (20 Hen. III. c. 6), and the Hundred Rolls (*temp.* Edw. I.) include a return as to marriages and wardships. The whole system became intolerably oppressive in the 16th and 17th centuries, and was finally abolished by statute, 12 Car. II. c. 24. A vast bulk of original documents respecting wards and minors down to the time of the act exists in the Public Record Office (see MARITAGIUM and WARDS).

H.

MARRIAGE-RATE may be defined as the ratio between the number of persons belonging to a certain population who marry in a year, or other unit of time, and the number of the population. This is the sense in which the term is used in the English registrar-general's tables. In other countries the number of marriages, not of persons married, is often used as the numerator of the fraction which forms the marriage-rate. It has been proposed to use for the denominator not the entire population, but only the marriageable part of it. Some international statistics of this "specific" marriage-rate are given by Bertillon in his masterly discussion of "Matrimonialité," in the *Annales de Demographie Internationale*, vol. i. p. 20.

The definition of marriage-rate presents a difficulty which has been met in the case of other rates, viz. that the population cannot be supposed constant during so long a period as a year. This difficulty might be serious if the population were very small, especially in a peculiar case mentioned by Prof. Westergaard, (in the *Revue d'Économie Politique* for May-June, 1891, p. 443), where the occurrence of a marriage tends to diminish the population under consideration, namely, the persons belonging to a certain occupation, which is usually abandoned on marriage.

The marriage-rate acts through the birth-rate on the increase of population. How indirect is this action appears by observing that in countries which have a particularly small natural increase, *e.g.* France and Massachusetts (·16 and ·65 per cent respectively, for the period 1865-1883, while the average for Europe is 1·06), the marriage-rate is either not particularly small (in France ·78 marriages per 100 living compared with ·83 for Europe), or even particularly large (in Massachusetts ·94 marriages per 100 living). For the number of the children to a marriage is particularly low in these countries (Marshall, *Principles of Economics*, note to ch. iv. bk. iv. 2nd ed.).

Among the causes of variations in the marriage-rate, vicissitudes in material prosperity are prominent. Dr. Farr, surveying the ups and downs of the marriage-rate in England for nearly forty years, assigns an external cause for each fluctuation, now the influx of Australian gold in the year of the great exhibition, now a commercial panic, or the Crimean, or even the Abyssinian war. A similar explanation is attempted by Dr. Bertillon in the publication above referred to. The price of the principal article of food is a main factor under this head; especially where the population is poor and near the brink of subsistence. The connection between the price of grain and the frequency of marriage is apparent in the statistics of Sweden and other continental countries[1] (cp. Sir Rawson Rawson, *Statistical Journal*, 1885, Quetelet, *loc. cit.* and most of the general treatises on statistics). In more advanced countries commercial crises and the state of international trade have at least as much effect as variations in the price of wheat on the marriage-rate. In England a fall in the marriage-rate has often been accompanied by a fall in the price of wheat (Dr. Ogle, *Journal of the Statistical Society*, vol. liii. (1890), p. 258). "The statistics even seem to suggest," says Prof. Marshall, "that this is not a casual coincidence," and he suggests an interesting explanation of the paradox (*Principles of Economics*, 2nd ed. bk. iv. ch. iv., § 8).

It may happen that though wealth increases, yet the standard of comfort increasing more quickly, the marriage-rate declines. This may be in part the explanation of the decline in marriage-rate which has occurred in recent years in many civilised countries [see Sir Rawson Rawson's *International Statistics*, p. 521, also *Movimento dello Stato Civile: Confronti Internazionali*, 1865-83, Tavola I. *bis*; and *Bulletin de l'Institut International de Statistique*, Table I., *bis*].

As another cause of variation in marriage-rates may be mentioned the different proportions of persons at each age in different populations. The manner in which the frequency of marriage varies with age is strikingly shown by a *stereogram* due to the Italian Statistical Museum, of which there is a copy in the rooms of the London Royal Statistical Society, an explanation in the society's jubilee volume, 1885, p. 247, and a criticism in the Journal for March 1894 (cp. Quetelet, *Physique Sociale*, vol. i. p. 275 and context).

Difference of season is also a cause of variation of marriage-rates, referred to periods shorter than a year. The deterrent influence of Lent is marked in Roman Catholic countries. A minimum in the month of March is matched in the adjacent months by maximum—or at least large—numbers of marriages displaced, as it were, from their natural position. On this head Quetelet well says: "Les lois naturelles ne sont point totalement effacées sans doute, mais il est difficile de saisir leurs effets au milieu des lois religieuses et des habitudes civiles." (*Physique Sociale*, vol. i. p. 261.)

The delicacy with which marriage-rates thus respond to the action of assignable causes is not inconsistent with the peculiar constancy which has been attributed to these statistics. The oscillations are not only precise, but also minute as compared with other coefficients in vital statistics—in particular with death-rates. This contrast is well shown by the diagram in Dr. Longstaff's *Studies in Statistics*, which presents the variation of the two rates from year to year in England. That of the two rates the one which depends more upon human volition should be the steadier is a circumstance deserv-

[1] See diagram, *Marriage-rate and price of rye in Prussia compared*, in art. on GRAPHIC METHOD.

ing the attention which it has received from Quetelet (*loc. cit.*) and others. It may be ranked with the stability of the numbers of suicides as one of the wonders of moral statistics. It is not unreasonably used as proof that the reign of law extends over the domain of volition. (Cp. Mill, *Principles of Logic*, bk. vi. ch. ii.—Venn, *Logic of Chance*.—Marshall, *Principles*, 5th ed. bk. iv. ch. iv.)

[In addition to the works cited in this article the general treatises referred to in the article on DEATH-RATE should be consulted.] F. Y. E.

MARRIAGE SETTLEMENT (also called ante-nuptial settlement), a settlement made, in contemplation of marriage, of funds respectively contributed by the intending husband and wife or their respective relatives or friends. The usual trusts of such settlements are: to pay the income of the husband's fund to the husband for life and the income of the wife's fund to the wife for life; after the death of either of them to pay the whole income to the survivor for life or until remarriage; after such death or remarriage to divide the fund among the children or issue of the marriage in such shares as the husband and wife or the survivor shall have appointed, and in default of appointment among the children of the marriage who shall attain the age of 21 years or, being daughters, marry under that age.

A marriage settlement, not being considered a voluntary settlement, is not defeasible in the settlor's bankruptcy.

One of the reasons which brought marriage settlements into general use, viz. the extensive rights which the law gave to a husband over his wife's property, has been removed by the Married Women's Property Act 1882 and the amending Acts, but the custom to have marriage settlements has remained unchanged.

No doubt the desire on the part of the friends of persons who are about to marry to secure an adequate and indefeasible provision for the intending husband and wife and their children is justifiable, but the practice of settling property, on marriage or otherwise, cannot, on the whole, be considered advantageous to the community. In the first place it diverts a considerable amount of capital from trade and industrial enterprise, and creates an artificial demand for so-called trustees' securities—thereby unduly increasing the facilities for borrowing of a special class of companies and public bodies. But its principal disadvantage is the fact that the persons concerned—knowing that in any event they can rely on a comfortable income—are less inclined to resist any temptation leading them to extravagance or recklessness. A system which allows a large number of persons to enjoy every comfort and luxury while their creditors must be satisfied with a small dividend on their claims, should not be encouraged by the law. If it were made illegal to impose any restraints on anticipated dealings with income, a great part of the mischief would be avoided. As the law stands, restraints on anticipation in express terms are invalid, except in the case of married women, but the ingenuity of draftsmen has overcome this difficulty by the insertion of clauses in many settlements declaring that the income is to be forfeited on any attempted alienation or on bankruptcy, and that on such forfeiture it is to be applied by the trustees for the benefit of the person to whom it originally belonged in his or her family. In this way the enjoyment of the income is virtually retained, and it is only the creditors who suffer by the forfeiture.

Marriage settlements like other settlements have always been subject to succession duty, and, when the interest of any successor exceeded £10,000, to Lord Goschen's estate duty, of 1 per cent, and to Sir William Harcourt's and Mr. Lloyd George's graduated estate duty. E. S.

MARRIED WOMEN IN FACTORIES. See FEMALE LABOUR.

MARSHALL, WILLIAM (1745-1818), was one of the few really noteworthy English writers on agriculture; to the student of agrarian development his works are probably quite as valuable as those of his contemporary and rival Arthur YOUNG, though their style and arrangement prevented their obtaining the same popularity. He came of farmer stock in the North Riding, and began his long series of agricultural experiments, and of treatises describing them, in 1774. His most important works fall into two groups. First come the twelve volumes in six pairs, describing the *Rural Economy* of Norfolk (1787), Yorkshire (1788), Gloucestershire (1789), the Midland Counties (1790), the West of England (1796), and the Southern Counties (1798), respectively. In these he carried out the *Plan* he had submitted to the Society of Arts in 1780; that is to say, he resided for a year or more, sometimes acting as agent or manager of estates, in one district after another, "minutely registering the provincial practice." Some time before, "in a journey of four or five hundred miles through the central parts of the Island, I experienced the inutility of a *transient view*,"—a thrust at the contemporary *Tours* of Arthur Young. The new Board of Agriculture and its secretary, Young, found in him an indefatigable critic; and the *Reports* or *Surveys* drawn up under its authority occasioned a second series of volumes from Marshall's pen. To show how much better he could arrange the material, he drew up in five volumes *A Review and Complete Account of the Reports to the Board of Agriculture* for the Northern (1808), Western (1810), Eastern (1811), Midland (1815), and Southern and Peninsular (1817) "departments," respectively. In 1808 he retired to an estate he had purchased on the vale of Cleveland, and died

there, while busy upon the construction of a building at Pickering for his proposed rural institute or college of agriculture.

[A list of his other works will be found in John Donaldson's *Agricultural Biography* (1854). Perhaps the most important of them are *Minutes of Agriculture, made on a farm of 300 acres of various soils, near Croydon, Surrey* (1778).—*Planting and Rural Ornament* (1796).—*On the Appropriation and Enclosure of commonable and intermixed lands* (1801).—*A Treatise on the Landed Property of England* (1806).] W. J. A.

MARTIN, Frederick (1830-1883), started in 1864 that useful publication *The Statesman's Year Book*, and edited it until the December of 1882.

Among his works are:—*Commercial Handbook of France*, London, 1867, 8vo.—*The History of Lloyd's and of Marine Insurance*, London, 1870, 8vo.

[*Dictionary of National Biography*, vol. xxxvi., p. 275.] H. E. E.

MARTIN, Robert Montgomery (1803-1868), historical writer and statistician, is said to have been born at Tyrone, Ireland. He studied medicine, but apparently never practised. In 1820 he visited Ceylon, and thence travelled to the Cape of Good Hope, Australia, and India. From 1831, when he completed his *History of the British Colonies*, to 1844, he lived in England, taking a great interest in colonial trade questions, and devoting an untiring energy to the compilation of statistics. He gave evidence before the committee on the China trade. In 1844, he was appointed treasurer of Hong-Kong, but did not succeed in that capacity. Soon returning to England, he gave himself up once more to statistical research.

His chief works, apart from his *History of the Colonies*, were:—*Ireland before and since the Union*, 1844.—*Political, Commercial, and Financial Condition of the Anglo-Eastern Empire*, London, 1832.—*Analysis of the Parliamentary Evidence on the China trade*, 1832.—*Ireland as it was, and ought to be*, 1833.—*Poor law of Ireland*, 1833.—*Taxation of the British Empire*, 1834.—*Statistics of the British Colonies*, 1839.—*Monetary System of British India*, 1841. In 1848 he republished his two works on Ireland under the title *Ireland as it Was, Is, and Ought to Be*, in order to show that "no greater evil could befall Ireland than a disunion of the solemn legislative compact of 1801." [*Dictionary of National Biography.*] C. A. H.

MARTINEAU, Harriet (1802-1876), became first famous through the publication of *Illustrations of Political Economy*, 18 vols. in 9, London, 1832-34, 16mo; the form of which was suggested by Mrs. Marcet's *Conversations on Political Economy*. In the curious autobiographical notice left behind for the *Daily News*, she wrote, "The original idea of exhibiting the great laws of society by a series of pictures of selected social action was a fortunate one; and her tales initiated a multitude of minds into the conception of what political economy is, and of how it concerns everybody living in society. Beyond this there is no merit of a high order in the work. It did not pretend to offer discoveries or elucidations of prior discoveries. It popularised in a fresh form some doctrines and many truths long before made public by others." Difficult as it may be to a generation which has been taught that *les dénoûments ne sont pas des conclusions* to credit it, the success of these tales was extraordinary. Within a few years their circulation reached to 10,000. Cabinet ministers, newspaper editors, and politicians appear to have vied for the privilege of having their proposals supported by the stories. A further series, *Poor Laws and Paupers illustrated*, 4 vols. in 2, London, 1833-34, 16mo, was undertaken at the suggestion of Lord Brougham. *Illustrations of Taxation*, 2 pts. 1834, 12mo, completed this branch of Miss Martineau's work. In her *History of the Thirty Years' Peace, 1815-1846*, 1849, 8vo, 2 vols., however, and in her *British Rule in India*, London, 1857, 8vo, considerable attention is given to the economic aspects of history. Her views on economic questions underwent great alterations. At first a "strict Benthamite," and adherent of the classical political economy, her American experiences considerably modified her views on the subject of property. She was led to expect further changes "which will probably work out in time a totally new social state," wherein the ideals of R. Owen (*q.v.*) would to some extent be fulfilled. Her breach with the old orthodox political economy was no doubt widened by the positivist influences under which she came.

[*Harriet Martineau's Autobiography, with Memorial by M. W. Chapman*, 3 vols. 1877, 8vo.—*Dictionary of National Biography*, vol. xxxvi. p. 309.] H. E. E.

MARTINEZ DE LA MATA, Francisco (middle of the 17th century). The author describes himself as a brother of the order of penitents and servant of the afflicted poor, on the title of his *Memoriales ó Discursos en razon del remedio de la despoblacion, pobreza y esterilidad de España*, which were published about 1650, and reprinted by Campomanes (*q.v.*) in his *Apéndice á la Educacion Popular*, vol. i., Madrid, 1775. Some extracts will also be found in Sempere y Guarinos, *Bib. Ec. Pol.*, vol. iii., Madrid, 1804. Martinez de la Mata is a fervent representative of the later form of mercantilism: "Kingdoms and republics flourish by the manufacturing and traffick of the produce of industry, tillage, and breeding; these reciprocally assist each other, but the *principal* nerve is manufactures (*artes*), which increase the population. . . . Labourers only bring into existence the fruits of the soil and leave them in the state in which nature supplies them; as long as they remain thus their value is

low, but this multiplies even a hundredfold when they are handed over to manufacturers," p. 3.

"France, Genoa, Venice, Florence, Holland, and England, have grown rich through the permission given to the subjects of Spain to consume their merchandise. . . . This is how they became deluged with gold and silver," p. 7.

He gives the list of the crafts (*gremios*) which had disappeared, p. 31; complains of the introduction of 120,000 foreigners, p. 130; describes, with many particulars, the professions which the latter had acquired, pp. 134 *seq.*; and gives details on the decline of some branches of industry, such as gloves in Ocaña, p. 252, and hosiery in Toledo, p. 261.

[Colmeiro, *Biblioteca de Economistas Españoles*, p. 115.] E. ca.

MARULLI, Vicenzo (18th century), a Neapolitan; one of the many Italian writers who in the 18th and beginning of the 19th century wrote on charity organisation then engrossing the attention of governments, and the labours of the studious. Marulli's work, like others, owed its origin to the inquiry made by the Neapolitan government in 1802, as to "the best means of maintaining and employing the poor of the kingdom of Naples and in the houses of correction." Marulli objects to begging, and would suppress it; he advises poor relief being carefully regulated in order that poverty may not be increased by it. He advocates establishing asylums, hospitals, etc., and especially a good organisation of public charity in order to avoid the disadvantages and incitement to idleness often arising from indiscriminate private charity. Begging can only be strictly forbidden when well-organised systems of charitable relief are established to meet the wants of the poor.

Ragionamento sulla mendicità, Naples, Stamperia Simoniana, 1804.

[Fornari, *Delle teorie economiche nelle provincie napoletane*, vol. ii., Milan, 1888.] U. R.

MARX, Heinrich Karl (1818-1883), distinguished as a socialistic theorist and agitator, was born at Trier. His father, who with his family passed in 1824 from Judaism to Protestantism, was a legal official. After receiving instruction at the gymnasium of his native place, Marx studied from the year 1835, first jurisprudence, then philosophy, at Bonn and Berlin. He settled at Bonn with the view of becoming a docent in the university. But his friend Bruno Bauer's difficulties with the government, arising from his theological views, convinced Marx that he too would find it difficult to maintain an academic position under Prussian rule. He and Bauer began, in 1842, at Cologne, the publication of the *Rheinische Zeitung* in the interest of the radical opposition. Towards the end of the same year Marx undertook the management of the journal, and removed from Bonn to Cologne. The government forbade the continuance of the paper from 1st January 1843; and Marx, accompanied by Arnold Ruge, now went to Paris, having first married a young German lady to whom he had been for years betrothed. He and Ruge entered on a joint journalistic enterprise, which, however, speedily came to an end, partly from a difference of principles between the two associates. Ruge attached himself to the Hegelian philosophy and political radicalism; Marx studied economics, and through the influence of French writers, notably Proudhon, became a socialist. In 1844 began the relation between Marx and F. Engels, which terminated only with the death of the former. Marx took part in producing a weekly journal published in Paris with the title *Vorwärts*, which covered with ridicule the absolutism and sham constitutionalism of the German princes. The Prussian government applied to the Guizot ministry for the expulsion of Marx from France, which was granted; and accordingly, at the beginning of 1848, he removed to Brussels, where he was joined by Engels. The two friends prepared, January 1848, the manifesto of the communist party at the request of a secret propagandist league; many German editions of this document have since appeared, and it has been translated into most of the European languages. The February revolution having broken out, Marx was expelled from Belgium, and at the invitation of the provisional government of the French republic, returned to Paris. He went to Cologne in the same year, and set on foot the *Neue Rheinische Zeitung;* among the contributors to this journal was Lassalle. After having been twice before the courts of law for advising resistance to the government, Marx was expelled from Prussia. Retiring to France, he was forced to quit that country also, and fixed his permanent residence in London. During the following years he wrote much on current politics, and was the English correspondent of the *New York Times*. The first-fruits of his long-continued economic studies appeared in his *Zur Kritik der politischen Oekonomie*, pt. i., 1859. But, finding himself not yet in a condition to develop the consequences of his fundamental principles, he discontinued this work, and, returning to his studies, embodied his views finally in *Das Kapital*, of which the first book was published 1867, the second was edited after the death of the author by Engels 1885. The third part appeared in 1894.

In 1864 the International Association was founded, and Marx early took a leading part in its proceedings. His plan of a body of statutes and his inaugural address were preferred to those of Mazzini, which were put in competition with them; and thus he became the chief of the organisation, and wrote all the documents issued by the general council. The watchword

of the party now became "Proletariate of all countries, unite." The fall of the French commune made the maintenance of the International in Europe impossible; the anarchists created internal discussions in the body; and the general council was transferred to New York. Marx now devoted himself diligently to the extensive studies required for the completion of his treatise, learning—it is said—with a view to this, the Old Slavonic, Russian, and Servian languages; he continued, however, to exercise great influence by correspondence and personal interviews with the socialist leaders in different countries. But his failing health increasingly impeded his work; and after the loss of his wife and of his eldest daughter, he died, sitting in his arm-chair. He was buried in Highgate cemetery.

The characteristic features of Marx's system are his view of the nature of capitalistic production, and his materialistic theory of history. According to him labour alone creates value, and the value of a commodity is measured by the quantity of labour which is socially, *i.e.* normally, necessary for its production. In existing society, the instruments of production are in comparatively few private hands. The other members of the community have nothing but their labour-power to sell. This is bought by the capitalist; but, even when he pays its market-price, he does not pay its full value; he appropriates to himself a portion of the product of the workman's labour, the whole of which ought to go to the workman; and what is so appropriated, called by Marx the *surplus-value* (*Mehrwerth*), is the source of the capitalist's income. A value equivalent to the workman's subsistence, or, in other words, to the wages actually paid him, would be produced in a small number of hours; but he is forced to work longer for those wages, and the product of this additional work, the surplus-value, goes into the capitalist's pocket, though he has no right to it. Hence, the effort of the capitalist to lengthen the working day, and of the workman to shorten it; and in this struggle, so long as it is a purely economic one, the weaker—the workman—goes to the wall. When the capital embarked in a successful enterprise is increased, the surplus-value, as a whole, is enhanced; and, as the productivity of labour rises with the progress of society, and as the workman's subsistence is thus supplied by a shorter labour-time, again the surplus-value is increased. Accordingly the tendency of the industrial world is to the development of industry on the great scale, and to the ever greater use of machinery; and the increased division of labour, thus rendered possible, leads to the employment of women and children in manufactures—a new exploitation of the working-classes for the advantage of the capitalist, which also depresses the wages of men. An intense war of competition goes on between different capitalists, and, whilst there is perfect organisation within the individual factory, there is anarchy in social industry, regarded as a whole, which results in periodically recurring crises. The changing proportions of "constant" and "variable" capital, *i.e.* of the permanent instruments of production on the one hand, and labour-power on the other, leads to fluctuations in the movement of population; and the result is the creation of a disposable industrial "reserve-army," on which capital can call to meet any special demand; and the existence of this class makes those who are actually employed more dependent and more willing to submit to the dictation of the capitalist. All this had been said in substance by other socialists; but Marx here introduces what appears to be a new conception of his own. The capitalist system, he says, contains within it the seeds of its own destruction. The concentration of vast enterprises in the hands of a few magnates, the centralisation of the means of production in modern industrial establishments, and the associated form which labour takes in these establishments, will make it easy, when the due time arrives, for the state, once subjected to the political control of the proletariate, to step into the place of the capitalist. Those who have been hitherto the expropriators of the workmen will now themselves be forcibly expropriated; all private will be transformed into collective enterprises, and the instruments of production will be used by the whole of society on a definite plan for its common ends.

The new social system thus to be arrived at is the last stage of a historical progress which Marx conceives as follows:—He adopts the view of Hegel (not peculiar, however, to that philosopher or his school) that the life of society is one of ceaseless change, the ideas and institutions of each period having only a rotative and temporary *raison d'être*, and necessarily giving place in due time to others which succeed as members of an ordered series. Marx holds—here diverging from his master—that the determining factor of these changes is purely material. The fundamental and causal element of the social evolution is economic. All other social forms—the legal, literary, religious,—in fact the entire civilisation of an epoch, is the outcome of its economic constitution—of the contemporary modes of production and exchange. The political state of a country at any period reflects the economic requirements of the class then dominating production; and thus all history, subsequent to the primitive community of land-ownership, is a picture of the successive wars of classes. In each period are developed under the ruling class new productive powers which ultimately become irreconcilable with the existing forms of production; and the class which represents these forces, and through them rises into importance, struggles with and overcomes that previously supreme. The constitution of society is changed, and a new order introduced. Thus feudalism was vanquished by the insurgent bourgeoisie; and the bourgeoisie in its turn will be overthrown by the class it now plunders and oppresses—the proletariat. This will be brought about not by any moral triumph of ideas of justice, but by a historical necessity inherent in the existing conditions and movement of industrial life. The long-continued series of social struggles will then be closed; class wars will be brought to an end by the disappearance of classes.

The adherents of Marx's doctrine speak of it as "scientific socialism," in contrast with the "utopian socialism" which in various shapes preceded it. This is certainly unjust, especially to RODBERTUS; if there be such a thing as scientific socialism, Rodbertus is entitled to be regarded as its founder. But, however this may be, Marx's work represents the now-prevalent form of socialism. *Das Kapital* has become, we are told, "the Bible of the social democrats." But it can only be a storehouse of facts and arguments for the leaders; it must be "caviare to the general." An English socialist has described Marx's style as "singularly brilliant"; but that is not the ordinary estimate. Roscher speaks of his "schwerfällig abstracte und doch unpräcise Ausdrucksweise," and Cossa characterises it as "stile sempre oscuro e talvolta inintelligibile."

Das Kapital has been translated into English by S. Moore and E. Aveling. Marx's friend Fr. Engels published in 1878 (2nd ed. 1886) *Herrn Eugen Dühring's Umwälzung der Wissenschaft;* and three chapters of this book were arranged as a pamphlet and translated into French by Marx's son-in-law Paul Lafargue (1880), with the title, *Socialisme utopique et Socialisme scientifique.* A good English version of this tract, bearing the same title, has been published (1892) by E. Aveling, and may be recommended as giving a clear and vigorous statement of the main lines of Marx's doctrine. The most remarkable of Marx's minor publications are the following:—*Einleitung zur Kritik der Hegelschen Rechtsphilosophie*, and *Zur Judenfrage*, 1843, in the former of which appear germs of thought which he afterwards more fully developed, especially his materialistic theory of history; *Die Heilige Familie*, 1845, written in conjunction with Engels in opposition to the philosophic views of Bruno Bauer; *Misère de la Philosophie*, 1847, in which he keenly criticised the *Philosophie de la Misère* of Proudhon, who had at one time much influenced his opinions, and in which the essential features of Marx's general economic system are already distinctly visible; *Discours sur la question du Libre Échange*, 1848; and *Der achtzehnte Brumaire des Louis Bonaparte*, a commentary on the history of the *Coup-d'État*, inspired by fierce indignation against L. Napoleon, and admiring sympathy with the insurgents of June 1848.

[For Marx's biography see art. on him by Fr. Engels in *Handw. der Staatswissenschaften.* Criticisms on his theories will be found in the same work, art. *Sozialismus und Kommunismus*, by Adler; in E. de Laveleye's *Socialisme Contemporain* (English trans. by Goddard Orpen), ch. iv.; Rae's *Contemporary Socialism*, ch. iii.; Bonar's *Philosophy and Political Economy*, bk. v. ch. i.; and the preface by Vilfredo Pareto to a series of extracts from *Das Kapital* published in the *Petite Bibliothèque Economique.* For the chief difficulty in the theory of surplus value and Marx's own way out of it, see Engel's Preface to *Kapital*, vol. iii., 1894, and the article on it by F. Butlin in *Econ. Journal*, 1895.] J. K. I.

MASERES, FRANCIS (1731-1824), mathematician and social reformer, was called to the bar in 1758. During the years 1766-69 he was attorney-general of Quebec. In 1773 he was appointed cursitor baron of the exchequer, a post he held till his death. He is said to have refused an increase of salary, but his private means were large. In 1774 he became a bencher of the Inner Temple, and is among the old benchers immortalised by *Elia.*

Maseres was the author of a *Proposal for establishing Life Annuities in Parishes*, London, 1772. A bill, embodying his scheme, passed the House of Commons in the session of 1772, but was thrown out by the lords. He defended it, in *Considerations on the Bill for enabling Parishes to grant Life Annuities*, London, 1773, 8vo, and again in his magnum opus, *The Principles of the doctrine of Life Annuities familiarly explained*, London, 1783, 4to. Its provisions, which enabled parishes to grant life annuities, and to invest the moneys received in the 3 per cent bank annuities in their own names, are worth noting, inasmuch as some politicians are advocating a solution of the Old-Age Pension question, by leaving to localities a large discretion in the initiation of various schemes. It is but fair, however, to say that Maseres did not believe that the life annuities he proposed would be bought by "day-labourers in husbandry, who are hardly able to save anything out of their wages."

The Principles, etc. is a volume of over seven hundred pages, but the great bulk of this is taken up with applications and illustrations. The actual principles are contained in the first ninety pages. Maseres made use of the tables of KERSSEBOOM and DEPARCIEUX, as given in the appendix of De Moivre's *Treatise on the Valuation of Annuities.* Maseres was also the author of numerous mathematical treatises, of pamphlets on subjects connected with North America, and of translations from the French. He also edited a great number of reprints of historical works.

[*Dictionary of National Biography*, vol. xxxvi. p. 407.] H. E. E.

MASLOV (19th century), a Russian economist, was the author of *Systems of Economics*, 1820; mentioned in Cossa's *Introduction to the Study of Political Economy*, p. 452 (trans. by L. Dyer, London, 1893) as belonging "to the domain of the history of economic literature." H. E. E.

MASSELIN, JEAN (died in 1500), was a canon of Rouen after 1468 and *orator* of the Norman clergy. Elected by the *bailliage* (bailiwick) of Rouen as its representative in the states general of 1484, he left a journal of their proceedings (*Diarium Statuum Generalium Franciæ*), and was himself on several occasions their spokesman, insisting with a firmness tempered by moderation on the necessity of financial reform.

The *Diarium* of Masselin was published 1835 (text and translation) in the *Collection des Documents Inédits pour l'Histoire de France.* E. Ca.

MASSIE, JOSEPH (d. 1784), economist and pamphleteer. He occupies an important position in the economic history of the 18th century, as a critic of the views of LOCKE and Sir Wm.

PETTY, and as having anticipated certain economic points more generally known in connection with the names of HUME and Adam SMITH. He wrote with insight on the causes of social and industrial evils, *e.g.* begging, prostitution, and theft; and foresaw what a noxious and plentiful crop of ills was springing up for a later generation to deal with, through sentimental philanthropy, the unreformed poor-law, and the herding of deserted and pauper children in barrack "homes." Above all, considering the epoch, he is noteworthy as having been one of the earliest advocates of the systematic study of economic and commercial matters upon a wide and well-verified basis of statistics and history, by applying to economics the inductive method of the Baconian philosophy. His extant works are mainly fiscal, dealing with monetary problems, various branches of trade, and questions of taxation (*v. infra*, Nos. 1-7, 10-12, and 14-25); some of these are quite short, and such as might now be published in the reviews, or even in the daily papers.

The most important of his works are five in number—the *Essay on the Governing Causes of the Natural Rate of Interest* (No. 1), *Calculations of Taxes* (No. 3), the *Plan for the Establishment of Charity-Houses* (No. 8), the *Knowledge of Commerce as a National Concern* (No. 16), and *Observations relating to the Coin of Great Britain* (No. 17).

In the *Natural Rate of Interest*, Massie criticises what he gathers to be the opinion of Locke, that the rate of interest at any given time depends on the proportion which the quantity of money in a country bears to the debts of its inhabitants to one another, and to its trade; that the profits of trade are instrumental in raising interest; and that the proportion which money bears to trade not only governs interest, but the profits of trade as well; while to Sir Wm. Petty, the rate of interest depended upon the quantity of money alone. Massie, on the other hand, who may or may not have been acquainted with Nicholas BARBON'S *Discourse of Trade* (1690), of which there seems to have been no copy among the fifteen hundred economic books and pamphlets which Massie collected at great outlay of time and money, and who anticipated Hume's published opinion on the same line of thought by two years, believed the governing causes to be (1) natural necessity; (2) liberty; (3) the preservation of men's private rights; (4) public security. He therefore concludes that the natural rate of interest is governed "by the profits of trade to particulars"; that the profits of trade are governed by the proportion which the number of traders bears to the quantity of trade; and that the number of traders in turn is governed by the necessity of trade, and the encouragement with which it meets.

In *Calculations of Taxes*, Massie pours mild ridicule on the "ingenious men" who had evolved the proportion of taxation to incomes out of their inner consciousness. No calculations could be valid unless based on the following data: (1) the number of people in the nation; (2) the pecuniary amount of their incomes or needful expenses; (3) the rise in prices both of commodities and of labour, which is caused by taxation; (4) the total sum paid annually in taxation throughout the whole kingdom. At the time Massie wrote the last item alone of these data was verifiable in the ordinary way. In order to arrive at some approximate idea of the proportionate amount of taxation contributed by individuals, he works out thirty typical cases, each containing such an annual balance-sheet as might naturally be worked out by each of thirty different heads of families in receipt of thirty different incomes, from a wealthy nobleman with a rent-roll of £20,000 a year to a rural labourer on 5s. a week.

The *Plan for the Establishment of Charity-Houses* and the other essays on social reform in the same volume are not only among the most interesting of Massie's writings in themselves, but are valuable on account of three positions which he there lays down, viz. (1) that the Elizabethan poor-law was a *causa causans* of evils which it was intended to cure; (2) that the removal of multitudes of people from "our natural and fixed basis, land, to the artificial and fluctuating basis, trade," is fraught with grave social and industrial evils; and (3) that the problem of prostitution is really not so much moral as economic. The remedies which Massie proposed were the equalisation of poor-rates in different localities, and the abolition of the settlement clauses of the poor-law; the union of parishes to support a workhouse; the entire separation of the honest and respectable poor from the loafer, the casual, and the "suspect," the three latter to be punished and put to hard labour in quite separate but neighbouring establishments, while the taint of pauperism was not to be attached to the former; the teaching of new trades to the honest and respectable poor, and the careful selection of new trades so as to avoid increasing the keenness of competition among persons already provided with suitable employment elsewhere; the establishment of charity-houses or "preservatories" for unemployed, deserted, or destitute women and girls, where they would be quite safe, and free from workhouse taint, and which would serve both as labour-bureaux and as training schools in newer industries. Massie laid great stress on national care for working women and girls, partly for the sake of the next generation; partly because competition for work, being within much narrower limits, is keener for women who stand alone than for men; partly from humanity, because they cannot resist brute force; and partly because a ruined woman almost inevitably becomes a social danger. In return for the national service rendered by women in every rank of life Massie held that the nation, and particularly London, should protect them from being driven to evil courses by economic distress, by means of a penny rate levied on all houses in the metropolis on the basis of the poor-rate assessment, in addition to voluntary contributions. Other contributory causes of 18th-century lack of employment Massie held to be the decline of the woollen trade, the enclosure of commons and waste lands, and the growing practice of letting *e.g.* 500 acres to one farmer rather than 50 acres to each ten farmers.

The *Representation concerning the Knowledge of Commerce as a National Concern* is a plea (1) for such organised national collection and systematic storage of economic and commercial facts as is now provided for, to a limited but increasing extent, by the various departments of the Board of Trade; (2) for the compilation of adequate outlines of commercial history—Massie here incidentally mentions that though he had spent twelve years in collecting some 1500 tracts, treatises, pamphlets, etc., on economic subjects, he yet found it impossible to compile satisfactory outlines of the history of any one British industry; and (3) for the recognition of economics as a branch of liberal education and learning, to be dealt with by persons of wide knowledge, trained intelligence, and impartial soundness of judgment, who would discover "fixed principles" instead of trying to further personal commercial interests.

Observations relating to the Coin of Great Britain criticises Locke's views on money, and contains Massie's own suggestions as to remedying the then scarcity of silver and the over-valuation of gold, and a reprint of Sir Wm. Petty's *Quantulumcunque*. In Massie's opinion the main thesis, which Locke had failed to *prove*, was that "money cannot be raised above its intrinsic value, or, in other words, be made to pass current for more than the gold and silver in it is really worth as bullion"; that an artificial over-valuation cannot be maintained, and that the only effect of such attempt is to cause a proportionate rise in prices. "The proper remedy for the present scarcity of silver money is reducing the current rates of guineas, and of other gold coins, which have long passed for more shillings and pence than the gold contained within them in bullion, when compared with the value of silver in bullion."

Massie's lesser works contain shrewd remarks apropos of *inter alia* the habitual fleecing of the British consumer by the West Indian sugar-planters; the fatuity of imposing a new cyder-tax just when the woollen trade showed a tendency to migrate from the cyder counties into beer-drinking Yorkshire; the raising of extra means to carry on the war (1757) by the commercially harmless plan of laying a tax on bachelors and childless widowers; and the view that the North American colonies were a distinct hindrance rather than an advantage to British trade.

Massie wrote and published at London, usually, if not always, at his own expense, the following works:

(1) *Essay on the Governing Causes of the Natural Rate of Interest*, 1750, 8vo.—(2) *Observations upon Mr. Fauquier's Essay on Ways and Means for raising Money to support the present War*, 1756, 8vo.—(3) *Calculations of Taxes for a Family of each Rank, Degree or Class: for one year*, 1756, 8vo.—(4) *A Letter to Bourchier Cleeve, Esq.; concerning His Calculations of Taxes*, 1757, 8vo.—(5) *Considerations on the Leather Trade of Great Britain*, 1757, 8vo.—(6) *Ways and Means for Raising the Extraordinary Supplies to carry on the War for Seven Years*, etc., 1757, 8vo.—(7) *Reasons humbly offered against Laying any further British Duties on wrought silks of the manufacture of Italy, the Kingdom of Naples and Sicily, or Holland*, 1758, 4to.—(8) *A Plan for the Establishment of Charity-Houses for Exposed or Deserted Women and Girls, and for Penitent Prostitutes; Observations concerning the Foundling-Hospital, Shewing the Ill Consequences of giving Public Support thereto; Considerations relating to the Poor and the Poor's-Laws of England; also A New System of Policy, most humbly proposed, for Relieving, Employing, and Ordering the Poor of England;* and *Forms of the principal Accounts necessary to be kept for those Purposes*, 1758, 4to.—(9) *Orders appointed by His Majestie (King Charles I.) to be straitly observed, for the Preventing and Remedying of the Dearth of Graine and Victuall* (a reprint), 1758, 8vo.—(10) *A Proposal for making a Saving to the Public of Many Thousand Pounds a Year in the Charge of Maintaining His Majesty's Marine Forces*, 1758, 4to.—(11) *Calculations and Observations relating to an Additional Duty upon Sugar*, 1759, s. sh. fol.—(12) *A State of the British Sugar-Colony Trade; shewing, that an Additional Duty of Twelve Shillings per 112 Pounds Weight may be laid upon Brown or Muscovado Sugar*, 1759, 4to.—(13) *Farther Observations concerning the Foundling-Hospital*, 1759, 4to.—(14) *A Computation of the Money that hath been exorbitantly Raised upon the People of Great Britain by the Sugar-Planters, in One Year, from January 1759 to January 1760*, 1760, s. sh. fol.—(15) *To the Printer of the Gazetteer. A list of the various classes of people employed in . . . the Woollen Manufactory; A State of the Exports to and Imports from the British Sugar-colonies; Facts . . . relating to the new Malt Tax*, etc., etc., 1760, obl. fol.—(16) *A Representation concerning the Knowledge of Commerce as a National Concern*, 1760, 4to.—(17) *Observations relating to the Coin of Great Britain . . . whereunto is annexed, Sir William Petty's Quantulumcunque concerning Money*, 1760, 4to.—(18) *Reasons humbly offered against laying any farther Tax upon Malt or Beer*, 1760, s. sh. fol.—(19) *General Propositions relating to Colonies*, 1761, s. sh. 4to.—(20) *Brief Observations concerning the Management of the War, and the Means to prevent the Ruin of Great Britain*, 2nd ed., 1761, 4to.—(21) *An Historical Account of the Naval Power of France, from its first Foundation to the present Time, with a State of the English Fisheries at Newfoundland for 150 Years past . . . to which is added, a Narrative of the Proceedings of the French at Newfoundland, from the Reign of King Charles the first to the Reign of Queen Anne . . . First printed in the Year 1712, and now reprinted for general Information*, 1762, 4to.—(22) *Observations relating to British and Spanish Proceedings . . . to which is added a Proposal for replacing the New Taxes on Malt and Beer*, 1762, 4to.—(23) *Observations on the new Cyder-Tax, so far as the same may affect our Woollen Manufacturies, Newfoundland Fisheries*, etc., 1764, fol. and 4to.—(24) *Brief Observations and Calculations on the present high Prices of Provisions*, 1765, s. sh. fol.—(25) *The Proposal, commonly called Sir Matthew Decker's Scheme, for one general Tax upon Houses, laid open, etc.*, date uncertain, but probably in or shortly after 1757.—(26) Papers of ephemeral political interest.—(27) MS. catalogue of Massie's

collection of economic books, pamphlets, etc., dated 29th November 1764, Lansdowne MS. 1049 in British Museum.

E.D.

MASTER AND SERVANT. The early history of the relation of master and servant in England is that of a gradual transition from a relation of status to one of contract. In Anglo-Saxon times there were two classes of workers, the *ceorls* and the *theows*, whose condition differed somewhat. The ceorls were in a condition intermediate between slavery and freedom, corresponding to that allowed by a conquering race to friendly natives of an invaded country: they had a certain choice of masters; they could hold land; they sometimes had slaves of their own; they had certain rights in the TOWNSHIP lands; they might acquire property, might purchase their freedom and might even become thanes. The theows were real slaves, as if they represented conquered hostile natives (*nativi*): they were not allowed to leave the land; they had no remedies against violence on the part of their master, and an injury done to them was a wrong done to the master; and they were, in fact, frequently sold abroad. The number of these slaves was increased by constant wars and by the practice of selling oneself to buy food or to pay a weregeld or to maintain a privilege of asylum. On the other hand, slavery tended to disappear under the influence of the church, which encouraged MANUMISSION; but at the same time the ceorls probably tended to become worse off. After the conquest, the condition of the actual slaves seems to have become better, while that of the ceorls and the Saxon masters was depressed; so that we find them mostly grouped as different varieties of one class of SERFS or VILLEINS. As time went on, the lot of the villein, though painted by Bracton in 1289 in miserable colours from the legal point of view, seems to have undergone substantial amelioration: various modes of becoming a FREEMAN became available, such as becoming a member of a gild in a privileged town and remaining in that town for a year and a day, escaping as runaways and not being followed up, being emancipated in order that they might be engaged as soldiers, and so forth; and in particular, he who had entered into a contract with his lord was considered as a freeman, and such contracts became very frequent, for the indefinite villeinage services were largely commuted for fixed money payments. Thus we find villeins holding land in their own right and employing labourers; so that except locally, in particular manors, the grievous incidents of villeinage (*see* VILLEINAGE) as described by Bracton seem, as Professor Thorold Rogers has pointed out, to have died out by the end of the 13th century, at any rate in their extreme form. The tendency to loosen the bonds of villeinage through neglect on the part of the lords, or through commutation of indefinite services for definite money rents, was at the same time somewhat neutralised by a tendency to read into the institution of villeinage the doctrines of SERVITUS (*q.v.*) of the Roman law; but the burden of proof came to rest on the lord asserting a claim, for much land had come to be held under villeinage tenure by persons whose status was that of freemen; and in the meantime the presumption of law was in favour of freedom, so that no seizure could be effected of any person alleged to be a villein. Thus things went on until the year 1349. In the meantime a great class of free labourers or craftsmen had sprung up in the towns; united in GILDS (*q.v.*) they were free as against the world, but were much restricted by the bye-laws of the gilds, which themselves restricted the individual liberty of non-members as far as they could, through prescription or custom, assert the right of doing so. In 1349 came the great plague, which thinned the ranks of labourers and raised the rate of wages. This was felt by the employers of the day to be a great evil; the old rights of villeinage were reasserted, and various attempts were made to enforce them. From the middle of the 13th to the middle of the 14th century the struggle lasted. The villeins resisted being interfered with, by litigation, by force, by rebellion, by ignoring the Ordinance of 1349 and the confirming statute of 1351 which attempted to regulate wages; and on the other hand, passports for travelling, poll-taxes, attempted exclusion from apprenticeship, investigation of pedigrees, and the like, were set in force; but the upshot was a practical defeat of the lords, for we find no averment in Jack Cade's rebellion of 1450 that the exactions of the lords were a grievance. By the time of Edward VI. and Elizabeth, villeins in gross—that is, persons whose personal status was that of villeinage—had almost died out; villeins regardant—that is, persons holding under villeinage tenure, and who might possibly be freemen—became merged in the copyholders; and the last reference to villeinage occurs in a law-suit of the year 1618, in which it was pleaded. Simultaneous with the decadence of the villeinage system was the growth of free labour; but its grievance was the want of work. The population grew much more rapidly than the means of support; and though many became attached to the manor-houses as "idle serving men" whose wages were nominal but who were fed and lodged, there

were still many reduced to vagrancy. This feature of English life first becomes extremely prominent during the reign of Henry VIII., and it was thought fit to enact the most severe laws against vagrancy or wandering in search of employment, from the place of settlement, without licence to do so. The attempt to suppress vagrancy was combined (5 Eliz. c. 4) with an attempt to regulate wages and to keep craftsmen under control: apprenticeship was enforced; craftsmen must render service in their craft when called upon, and that at rates to be fixed by the justices at Easter sessions; and refusal to do so was enforceable by imprisonment. As regards workmen, the policy of the act of Elizabeth was the policy of English law until 1867: breach of contract of service remained until that year an offence punishable by imprisonment; and a long series of acts extended the principle to particular cases and made it, after the Union, apply to Scotland. Any able-bodied person not having any visible means of livelihood could, at law, be put to service; but a large part of the original act had long fallen into abeyance, for the justices had long ceased to assess wages at sessions. Overlapping these acts were the series of FACTORY ACTS from 1802 onwards, and the Merchant Shipping Acts; and in 1867 the contract of service was finally reduced to the same condition as any other contract, and breach of it made punishable, except in particular instances, only by damages, while combination was no longer illegal as a means of keeping up or raising wages, and the restrictions on the emigration of workmen were removed. The relation of master and servant is thus now a question of contract: but Mr. Macdonell points out in *Master and Servant* that there are still some points in respect to which the maxims of English law seem to a greater or less extent to have been founded on the relation of status. These are: that a master is justified in committing an assault in defence of his servant, or a servant of his master; that possession by the servant is possession by the master, and that the master is liable for his servants' acts, apparently to an extent beyond that traceable to mere agency; that an action lies for enticing away or harbouring a servant; that the master has, in theory, a right of correcting his servant, though this is now probably not the law; and that in many cases somewhat outside the domain of mere agency, acquisitions by the servant are acquisitions for the master. Besides this, the older ideas seem to cling to the word "servant," so that it is very difficult to frame a definition of it, applicable to all cases, from those of a Carriers Act to an action by a father for loss of his daughter's services by seduction of her. Mr. Macdonell suggests the following: —"One who for a consideration agrees to work subject to the orders of another."

[An excellent historical summary, with full references, is given in Macdonell's *Master and Servant;* which, with Smith's *Master and Servant*, and Eversley's *Law of the Domestic Relations*, may also be consulted for the law. For the Scots law, see Fraser's *Master and Servant.*—See Vinogradoff, *Villainage in England.*—Broom, *Constitutional Law* (Somersett's case and the notes upon it). See MANOR.] A. D.

MASTERS' ASSOCIATIONS. Some of these societies aim at providing the benefits of insurance and trade protection for their members, without any special reference to their relations with their work-people, while others have been formed for the express purpose of joint resistance when individual employers have found themselves too weak to cope with the growing strength of the men's trade unions. The majority, however, may be considered to have both objects in view. There are at present about 100 of these masters' associations in existence, about a quarter of the total number being connected with the building trade. Being "temporary or permanent combinations for regulating the relations between workmen and masters, or masters and masters," they are trade unions within the meaning of the trade union acts. Few, however, are registered under those statutes (see TRADE UNIONS; ENGINEERING TRADES, App., Vol. I.). T. G. S.

MASTROFINI, MARCO (19th century), born at Monte Compatri near Rome. He became an abbé, and is best known to economists through his book on usury, *Le usure* (Rome, 1831), which was well received, republished several times, and gave rise to much discussion. Though Mastrofini lived in last century, his opinions entitle him to be ranked among the canonists. His book in fact revives the old disputes as to the lawfulness of interest (see CANON LAW).

Mastrofini analyses the question of usury, taking it primarily from the standpoint of the ecclesiastic and of the moralist, rather than from that of the political economist. He argues from a desire to reconcile the doctrine of the church with the requirements of economics, and with a somewhat ostentatious display of learning in support of a theory, already broached by other writers, that the prohibition of the canonists referred not to interest received on money, but to usury in its more modern sense, that is to say, to exorbitant interest. He therefore asserts that a moderate compensation for the loan of capital is theologically permissible. He further maintains that the church prohibition had reference only to poor debtors. But while we may appreciate Mastrofini's endeavours to legalise, from a theological point of view, a fact which is rooted in the public economy of the world, we must recognise that his assertions are historically incorrect, and not based on a thoughtful interpretation of those on whose testimony he relies.

MATHEMATICAL METHOD IN POLITICAL ECONOMY. The idea of applying mathematics to human affairs may appear at first sight an absurdity worthy of Swift's Laputa. Yet there is one department of social science which by general consent has proved amenable to mathematical reasoning—STATISTICS. The operations not only of arithmetic, but also of the higher calculus, are applicable to statistics (see ERROR, LAW OF, and PROBABILITY). What has long been admitted with respect to the average results of human action has within the last half-century been claimed for the general laws of political economy. The latter, indeed, unlike the former, do not usually present numerical constants; but they possess the essential condition for the application of mathematics: constancy of *quantitative*—though not necessarily numerical—relations. Such, for example, is the character of the law of DIMINISHING RETURNS (*q.v.*): that an increase in the capital and labour applied to land is (tends to be) attended with a less than proportionate increase in produce. The language of FUNCTIONS is well adapted to express such relations. When, as in the example given, and frequently in economics (see Marshall, *Principles*, 5th ed. preface, p. xix.), the relation is between *increments* of quantities, the differential calculus is appropriate. In the simpler cases the geometrical representations of functions and their differentials may with advantage be employed (cp. CURVES and FUNCTIONS).

Among the branches of the economic calculus *simultaneous equations* are conspicuous. Given several quantitative—though not in general numerical—relations between several variable quantities, the economist needs to know whether the quantities are to be regarded as *determinate*, or not. A beautiful example of numerous prices determined by numerous conditions of supply and demand is presented by Prof. Marshall in his "bird's-eye view of the problems of joint demand, composite demand, joint supply, and composite supply" (*Principles*, Mathematical Appendix, note xxi.). "However complex the problem may become, we can see that it is theoretically determinate" (*Ibid.*, cp. Preface, p. xx.). When we have to do with only *two* conditions, two *curves* may be advantageously employed instead of two *equations* (see CURVES and FUNCTIONS).

The mathematical operations which have been mentioned, and others—in particular the integral calculus, are all contained in the calculus of *maxima* and *minima*, or, as it is called, *of variations;* which seems to comprehend all the higher problems of abstract economics

For instance, Prof. Marshall, after writing out a number of equations "representing the causes that govern the investment of capital and effort in any undertaking," adds, "they may all be regarded as mathematically contained in the statement that H − V [the net advantages] is to be made a maximum" (*Princ.* Math. App., 2nd and later editions, note xiv.). It was profoundly said by Malthus, "Many of the questions both in morals and politics seem to be of the nature of the problems *de maximis et minimis* in fluxions." The analogy between economics and mechanics in this respect is well indicated by Dr. Irving Fisher in his masterly *Mathematical Investigations*.

The property of dealing with quantities not expressible in numbers, which is characteristic of mathematical economics, is not to be regarded as a degrading peculiarity. It is quite familiar and allowed in ordinary mathematics. For instance, if one side of a plane triangle is greater than another, the angle opposite the greater side is greater than the angle opposite the less side (*Euclid*, Book I.). Quantitative statements almost as loose as those employed in abstract economics occur in the less perfectly conquered portions of mathematical physics, with respect to the distances of the fixed stars, for instance (see Sir Robert Ball, *Story of the Heavens*, ch. xxi.); *e.g.* before 1853 it was only known that "the distance of 61 Cygni could not be *more* than sixty billions of miles." It is really less than forty billions.

The instance of astronomy suggests a secondary or indirect use of mathematical method in economics, which physical science has outgrown. As the dawn of the Newtonian, or even of the Copernican, theory put to flight the vain shadows of astrology, so the mere statement of an economic problem in a mathematical form may correct fallacies. Attention is directed to the data which would be required for a scientific solution of the problem. Variable quantities expressed in symbols are less liable to be treated as constant. This sort of advantage is obtained by formulating the relation between quantity of precious metal in circulation and the general level of prices, as Sir John Lubbock (senior) has done in his pamphlet *On Currency* (anonymous, 1840). Thus the mathematical method contributes to that negative or dialectic use of theory which consists in meeting fallacious arguments on their own ground of abstract reasoning (see some remarks on this use of theory by Prof. Simon Newcomb in the June number of the *Quarterly Journal of Economics*, 1893; and compare Prof. Edgeworth, *Economic Journal*, vol. i. p. 627). The mathematical method is useful in clearing away the rubbish which obstructs the foundation of economic science, as well as in affording a plan for the more regular part of the structure.

The modest claims here made for the mathe-

matical method of political economy may be illustrated by comparing it with the literary or classical method in the treatment of some of the higher problems of the science. The fundamental principle of supply and demand has been stated by J. S. Mill with much precision in ordinary language (*Pol. Econ.*, bk. iii. ch. 2, §§ 4, 5, and, better, review of Thornton, *Dissertations*, vol. iv.). But he is not very happy in indicating the distinction between a rise of price which is due to a diminution of supply—the dispositions of the buyers, the DEMAND CURVES remaining constant—and the rise of price which is due to a displacement of the demand curve. He appears not to perceive that the position of equilibrium between supply and demand is *determinate*, even where it is not *unique*—a conception supplied by equations with multiple roots or curves intersecting in several points. The want of this conception seems to involve even Mill's treatment of the subject in obscurity (*Pol. Econ.*, bk. iii. ch. 18, § 6).

The use of simultaneous equations or intersecting curves facilitates the comprehension of the "fundamental symmetry" (Marshall) between the forces of demand and supply; the littérateurs lose themselves in wordy disputes as to which of the two factors "regulates" or "determines" value.

The disturbance of the conditions of supply by a tax or bounty, or other impediment or aid, gives rise to problems too complicated for the unaided intellect to deal with. Prof. Marshall, employing the mathematical theory of CONSUMERS' RENT, reaches the conclusion that it might *theoretically* be advantageous to tax commodities obeying the law of decreasing returns in order with the proceeds to give bounty to commodities following the opposite law (*Principles*, bk. v. ch. xiii. § 7). The want of the theory of consumer's rent renders obscure Mill's treatment of the "gain" which a country may draw to itself by taxing exports or imports (*Pol. Econ.*, bk. v. ch. 4, § 6; cp. bk. iii. ch. 18, § 5). This matter is much more clearly expressed by the curves of Messrs. Auspitz and Lieben (*Untersuchungen*, Art. 81).

The preceding examples presuppose free competition; the following relate to monopoly. The relation between the rates and the traffic of a railway is shown with remarkable clearness by the aid of a diagram in the appendix to Prof. Hadley's *Railroad Transportation*. By means of elaborate curves Prof. Marshall shows that a government having regard to the interest of the consuming public, as well as to its revenue, may fix a much lower price than a monopolist actuated by mere self-interest. The taxation of monopolies presents problems which require the mathematical method initiated by COURNOT. His reasoning convinces of error the following statement made by Mill (bk. v. ch. 4, 6) and others: "A tax on rare and high-priced wines will fall only on the owners of the vineyard," for "when the article is a strict monopoly . . . the price cannot be further raised to compensate for the tax." Cournot obtains by mathematical reasoning the remarkable theorem that in cases where there is a joint demand for articles monopolised by different individuals, the purchaser may come off worse than if he had dealt with a single monopolist. This case is more important than at first appears (Marshall, *Princ.*, 2nd ed. bk. v. ch. x. § 4, 5th ed. bk. v. ch. xi. § 7).

Under the head of monopoly may be placed the case of two individuals or corporate units dealing with each other. The indeterminateness of the bargain in this case is perhaps best contemplated by the aid of diagrams (see on this case article on EXCHANGE, VALUE IN, and references there given).

These examples, which might be multiplied, seem to prove the usefulness of the mathematical method. But the estimate would be imperfect without taking into account the abuses and defects to which the method is liable. One of these is common to every *organon*—especially new ones—liability to be overrated. As Prof. Marshall says, "When the actual conditions of particular problems have not been studied, such [mathematical] knowledge is little better than a derrick for sinking oil-wells where there are no oil-bearing strata." Again, the mathematical method is a machinery, the use of which is very liable to be overbalanced by the cost to others than the maker of acquiring it. Not only is mathematics a foreign language "to the general"; but even to mathematicians a new notation is an unknown dialect which it may not repay to learn. As Prof. Marshall says, "It seems doubtful whether any one spends his time well in reading lengthy translations of economic doctrines into mathematics that have not been made by himself."

This estimate of the uses and dangers of mathematical method may be confirmed by reference to the works in the subjoined list; which does not pretend to be exhaustive.

MATHIAS DE SAINT JEAN, Jean Éon (1600-1681), known as *Frère procureur général* of the Carmelite friars in France, pub. under the name of "an inhabitant of Nantes," *Le Commerce Honorable ou Considérations politiques contenant les motifs de nécessité, d'honneur et de profit qui se trouvent à former des Compagnies de toutes personnes pour l'Entretien du Négoce de Mer en France*, Nantes, 1646.

As shown by the title, this book initiates the policy followed later by Colbert when he encouraged the foundation of the great trading companies with both Indies, the Levant, and Senegal. Mathias has a general and a special object. His general object is to demonstrate the natural usefulness and legitimacy of international trade and navigation, "which afford the most convenient and easy means granted by God to establish a perfect and universal society amongst the nations of the earth" (p. 133), an argument on which Mathias extensively dilates with great warmth and insight. His special object is to prove that French navigation being in a condition of utter decay, which he ascribes to the national want of enterprise, to depreciation of trade as a profession, and to the keenness of foreign competition, the securest way to emerge from this state of stagnation is to establish powerful trading and maritime companies, the shares of which ought to be subscribed by the French *noblesse;* this, he maintains, can be done without any fear or danger of a loss of status on their part. He also gives detailed statistical information on the imports effected in French ports by foreign bottoms, and calculates the profits which foreigners derive from these imports.

As to the practical legislation recommended, Mathias is not very consistent with his premises on the inherent usefulness of international trade. In his opinion the exclusion of foreign flags and strict reciprocity of custom-house duties would be insufficient to restore prosperity to French trade, and he advocates the return to the "just and wise by-laws" (p. 61), against foreign merchants which compelled them to take up their abode in the house of a known merchant,[1] and to offer their wares for sale at once. But he did not allow them to act as agents of foreign commercial houses. E. Ca.

MATTIA (di), Nicola (18th century). Mattia, in reply to the inquiry made in 1802 by the Neapolitan government as to the best means of maintaining the poor (see Marulli), says that charity can be but a temporary remedy in doing this which can only be secured by placing poor citizens in a position to supply their wants by their own work. The real remedy for begging and vagrancy is to eliminate the causes of the evil by encouraging the sources of wealth. Charitable assistance should be temporary, and only given to those incapable of work. Almshouses even should be temporary, because the hope of finding an asylum in them encourages idleness. Vagrancy should be remedied by cultivating the uncultivated land in the kingdom of Naples, and thus forming a civilised and industrious nation. Mattia proposes the establishment of houses of correction and the assigning to them of waste land for cultivation.

Riflessioni su l'impiego dei poveri e dei vagabondi, e sul modo di estirparli dalla società civile, relativamente al Regno di Napoli, Naples, 1805.

MATRICULATION TAX. See Finance, Germany.

MATURITY OF BONDS. A bond, or debenture, usually matures after a given time, and is then presentable for redemption to the issuing state or corporation like a matured bill. Sometimes a bond is "drawn" by lot, and is then redeemable at par, or at some specified price, and those who possess bonds, subject to such drawings, should ask their banker or broker to make proper inquiry from time to time. A. E.

MAUGHAM, Robert (d. 1862), co-founder with Bryan Holme of the Incorporated Law Society, and its first secretary. Maugham was an active promoter of the interests of the legal profession, and wrote several legal textbooks and handbooks. His chief work, from the economic standpoint, is his *Treatise on the Principles of the Usury Laws*, in which, taking as a motto Shakespeare's "Borrowing dulls the edge of husbandry," he briefly traces the history of the statutory regulation of interest on loans, adversely criticises the proposal made in the early years of last century to repeal the usury laws which fixed the maximum rate of interest at 5 per cent, and contends that, while the laws may occasionally press hardly on individuals, it is essentially desirable, in the interest of the nation generally and on general principles of public utility, that there should be some legal restriction upon the rate of interest demanded. Further, he maintains that there are excellent reasons, given in detail, why there should be some distinction in the law between dealing in money and dealing in other species of property. He criticises Bentham's *Defence of Usury* closely and in detail, and also examines the criticism of Lord Redesdale's views by Sir W. D. Evans, quotes from Grotius, Pufendorf, Vattel, Paley, Bacon, Blackstone, and Adam Smith, and refers also to the Jewish regulations, which were political rather than ethical. Maugham also wrote a treatise on the

MAUNDY MONEY. The royal alms, known as "His Majesty's Royal Maundy," are distributed annually by the Lord High Almoner on Maundy Thursday, on behalf of the King. They consist of various cash payments made to persons of both sexes over sixty years of age, who are in necessitous circumstances, and who have at one time given employment to others and paid rates and taxes.

One of the maundy gifts is a payment, made in silver coins, of the value of as many pence as the years of the reigning sovereign's age, to a like number of persons of both sexes. In the present year (1912), therefore, forty-seven men and forty-seven women receive the sum of 3s. 11d. apiece. The money is paid entirely in silver coins of the nominal value of 1d., 2d., 3d., and 4d. respectively, and it is to these small silver pieces, which are struck specially at the Royal Mint for the purpose, that the title "Maundy Money" is applied. These coins bear on the obverse the effigy of His Majesty, with the inscription, "Georgius V. D: G: Britt: Omn: Rex: F: D: Ind: Imp:; and on the reverse the figure "1," "2," "3," or "4," surrounded by a wreath of oak and laurel leaves, and surmounted by the royal crown. The edges of the coins are not milled, and the threepences, therefore, are identical with the coins of that denomination struck for general circulation. Collectors of coins frequently purchase the maundy monies from the original recipients, at enhanced prices, and with the exception of the threepences, a few of which may occasionally find their way into circulation, maundy coins do not pass into general use. The first coinage of small silver pieces intended solely for distribution on Maundy Thursday was struck in 1663. Prior to that date silver pence had been struck for general circulation, and the coins which formed part of the maundy alms were such as were to be found in the ordinary currency of the country.

The title Maundy, applied to the Thursday before Easter, is derived from "dies mandati"—the day of the mandate—as, on the day before Good Friday, Christ, after washing the disciples' feet, gave his new commandment, "That ye love one another" (John xiii. 34). Hence arose the custom of washing the feet of the poor by royal and other distinguished persons. This ceremony, which was accompanied by doles of food and clothing, can be traced back to the 4th century. James II. was the last king of England who washed the feet of the recipients of the maundy doles, but the custom is still occasionally observed in Austria and other European countries. The baskets from which the "mandate bread" was given away became known as "maunds."

At the ceremony of washing the feet of the poor, it was an ancient custom of the kings and queens of England to present one or two of the most necessitous with a gown from the royal wardrobe. This gift was, however, subsequently redeemed by a money payment supposed to represent the value of the garment.

As no provision was made to ensure the suitability of the maundy gifts to the various requirements of the poor persons, somewhat rough bartering among the recipients frequently took place, and, with a view to check these practices, the various doles were from time to time substituted by money payments, the last of the gifts in kind to survive being that of clothing for the men, which was distributed so recently as the year 1881. It having been found, however, that in most instances the men parted with the goods for less than their original cost, a sum of £2 : 5s. per head is now given instead of clothing. Thus the maundy alms are at the present time composed entirely of cash payments, amounting in all to about £5. The total sum is made up as follows: (1) The gift of pence per year of the sovereign's age, which is handed to the selected persons in a white leather purse; (2) sums of £1 : 10s. in lieu of provisions, and £1 in lieu of the gown formerly given by the sovereign, inclosed in a red leather purse; and (3) a further gift of 35s. to the women, or 45s. to the men in lieu of clothing, this last gift being inclosed in a paper packet.

The ceremony of the distribution of the maundy alms, which is of much interest, took place in the Chapel Royal, Whitehall, from 1714 to 1890, but since the latter date, the chapel having been closed, the gifts are distributed in Westminster Abbey. F. E. A.

MAURICE, JOHN FREDERIC DENISON (1805-1872), is noticed here for his connection with the Christian socialists (see CHRISTIAN SOCIALISM). We must remember, however, his protest against the "attempt to treat a human being as composed of two entities, one called religious, the other secular." As early as 1836 he expressed

his conviction that "political economy is not the foundation of morals or politics, but must have these for its foundation or be worth nothing." For many years he brooded over social questions. As chaplain at Guy's Hospital, we find him regretting his own helplessness. In 1840 and again in 1842 weighty letters from Mr. Daniel Macmillan, on the divorce of the Church and the leaders of the working classes, addressed to Archdeacon Hare, and forwarded to Maurice, gave much food for thought. In 1844 he made acquaintance with C. KINGSLEY and was appointed in 1846 chaplain at Lincoln's Inn. In the same year Mr. Ludlow suggested to him a scheme for bringing the leisure and good feeling of the Inns of Court to bear upon the destitution and vice of the neighbourhood. In 1848 he became editor of *Politics for the People*, a weekly publication, which only lived through seventeen numbers. The first number, on 6th May, contained a characteristic article by him on "Fraternity." In December of the same year the Bible readings were begun, from which sprang the meetings with working-men, held at Maurice's house during 1849. These meetings bore fruit in the starting of a Tailors' Co-operative Association. Maurice had appeared, at times, somewhat lacking in enterprise; he had a natural distrust of the spasmodic energy of the "go ahead." In advocating co-operation, he did not commit himself to any specific social plan. He remained throughout true to the conviction that the fundamental fallacy lay in "assuming that lands, goods, money, or labour are the basis of society, whereas human relations not only should, but do, lie beneath." In November 1850 appeared the first number of the *Christian Socialist*. By socialism Maurice meant "the acknowledgment of brotherhood in heart, and fellowship in work." The name suggested a struggle with unsocial Christians and un-Christian socialists. Years afterwards he justified its use on similar grounds. Yet above all he dreaded the formation of a new party with himself as leader. He protested against elaborate machinery, and held that to build associations upon decrees of a central board, was to build upon the sand. He saw clearly the danger of weakening moral influence by intermeddling with commercial details, and recognised in the Working-Men's College, founded in 1854, a more excellent way of serving co-operation. The following passage, written in 1849, and repeated almost verbatim in 1868, represents his economic faith. "The state, I think, cannot be communist; never will be; never ought to be. It is by nature and laws conservative of individual rights, individual possessions. . . . But the church, I hold, is communist in principle; conservative of individual rights and property only by accident. . . . The union of church and state . . . is precisely that which should accomplish the fusion of the principles of communism and property." It is noteworthy how closely this view resembles that of the CANON LAW (*q.v.*) towards private property. Nothing is easier than to criticise the Christian socialists: that the co-operative societies started by them mostly failed, while those started by the hard-headed workmen of the north (see CO-OPERATION) succeeded, was only what was to be expected. Yet even the direct results were not without importance, since the act of 1852, which legalised the position of such societies, was mainly their work. It is, however, to the indirect results that we must chiefly look. If the whole attitude of the working-class leaders towards religion and culture has been revolutionised, if the church of England, in its relations with the English people, has felt the breath of a new spirit, it is to the Christian socialists, and above all to Maurice, that the result is in large measure due. When he died there was a burst of popular grief such as had not been, it was said, since the death of the Duke of Wellington. Mystic, subtle, as he might be, working men understood him, because he understood them and their requirements—that a message for them to grasp must be something other and more living than mere opinions.

Of his forty-eight published volumes, not one is directly concerned with economic questions, and yet of all of them it may be said, as of his preaching at Lincoln's Inn, that whatever turn they take, they bring one's thoughts to the present day. As a good example of his manner may be cited the Lecture on masters and servants, in *Social Morality*, London, 1869, 8vo.

[For his attitude towards social questions see the correspondence in his life, edited by his son, Frederic Maurice, London, 1884, 8vo, 2 vols., and Charles Kingsley's Life, edited by Mrs. Kingsley, London, 1877, 8vo, 2 vols.—Art. by Prof. John on "Genossenschaftsbewegung" in *Zeitschrift für Volkswirthschaft* (Wien, band iii. heft iii. October 1894).—Art. by Thos. Hughes in *Econ. Review*, April 1891.] H. E. E.

MAUVILLON, JAKOB (1743-1794), an eminent German economist of the school of the PHYSIOCRATS, was born at Leipzig, the son of a Frenchman settled there as teacher of languages. He studied the science of engineering, and in 1771 entered the Carolinum at Cassel as teacher of military architecture; here the title of captain was conferred on him in 1778. In 1784 he was called to the Carolinum at Brunswick as teacher of politics and military tactics; here he attained the rank of lieutenant-colonel. His literary career began with translating French and English works and treatises into German, particularly the *Histoire philosophique et politique des établissements et du commerce des Européens dans les deux Indes*, by RAYNAL (Hanover, 1774-78). His conversion to the doctrines of the physiocrats was brought

about by translating Turgot's *Réflexions sur la formation et la distribution des richesses.* This appeared at Lemgo in 1775, under the title of *Untersuchungen über die Natur und den Ursprung der Reichthümer und ihrer Vertheilung unter den verschiedenen Gliedern der bürgerlichen Gesellschaft* (Enquiries into the nature and origin of Riches, and their distribution among the various members of Society). He came forward as a convinced adherent of the new doctrine in the *Sammlung von Aufsätzen über Gegenstände aus der Staatskunst, Staatswirthschaft und neuesten Staatengeschichte* (Collection of Essays on matters of Politics, Political Economy, and the most recent State-History), 1st vol. 1776, 2nd vol. 1777. Besides a number of economic treatises by foreign authors, including J. TUCKER'S *Four Tracts*, the work also contains an exhaustive essay by Mauvillon himself:—*Von der öffentlichen und privaten Ueppigkeit und den wahren Mitteln ihr zu steuern, nach den Grundsätzen der neueren französischen Physiokraten* (On Public and Private Luxury (*Luxe*), and the true means of checking it, according to the principles of the later French Physiocrats). This essay is remarkable, that in it for the first time, evidently borrowed from the French compilation "Physiocratie," by DU PONT (1768), the expression "physiocratic system" was employed for Quesnay's doctrine, and "Physiocratists" for his followers.[1] Mauvillon dedicated the book to C. W. Dohm, his colleague, at that time professor of cameralistic science at the Carolinum at Cassel, whose antagonism to the "physiocratic system" he knew, and whom he, in the dedication, invited to a rejoinder. Thence a literary conflict arose round the "physiocratic system," in which there took part, besides Dohm, who answered in a treatise published in the Deutsches Museum, *Kurze Darstellung des physiocratischen Systems* (Short explanation of the Physiocratic System) (1778), a large number of other political authors. (On this conflict, see article GERMAN SCHOOL OF POLITICAL ECONOMY.) In 1780, Mauvillon published a rejoinder, *Physiokratische Briefe an den Herrn Professor Dohm* (Physiocratic Letters to Professor Dohm). This is his principal work in economics.

Mauvillon is described by W. Roscher as intellectually the most important of the German physiocrats. That, however, is saying too much, since this position is undoubtedly due to SCHLETTWEIN (*q.v.*). Mauvillon acknowledges in the *Physiocratische Briefe* (Physiocratic Letters) themselves, that he has read but little of original physiocratic compositions. "There may thus perhaps be many things in my essays that are not entirely physiocratic, or that have not been said, or have been expressed differently, by the French economists. All that I desire is, that what I have said should be proved to be true. But if a name is needed, call it *Mauvillonish*" (p. 202). This "Mauvillonish" idea apparently causes him, in the treatise on "Luxury," to arrange the three social classes in such a manner that the landed gentry form a member of the productive class; but on the other hand besides the sterile unproductive class is made a special *salaried* class, composed of public officials, clergy, artists, and so forth. Mauvillon shares the full enthusiasm of the French physiocrats for their opinions. Quesnay's system is not to him like any other, that has advantages and disadvantages, but it is the only true system; it must, like virtue, be the best under all circumstances.—The co-operation of Mauvillon, in the work published by Count H. G. Mirabeau: *De la Monarchie Prussienne sous Frédéric le grand*, 1788, is well known. Mauvillon also published this work, some years afterwards, in German, under the title of *Von der Preussischen Monarchie unter Friedrich dem Grossen unter Leitung des Grafen von Mirabeau abgefasst und in deutsche Uebersetzung herausgegeben von J. Mauvillon Herzogt Braunschweigischen Oberstlieutenant* (On the Prussian Monarchy under Frederick the Great. Composed under the direction of Count Mirabeau, and published in German translation by J. Mauvillon, Lieutenant-Colonel of the Duchy of Brunswick), 1793. In the preface he describes his own share of the work as follows:—"Count Mirabeau really did not write this work, and the calumnious rage of his enemies and mine has compelled me to make this known. Only a few additions in the first and last books, and in the article on silk manufactures are by him. But to him, nevertheless, is mainly due the honour of the book, for he had conceived the idea of it, instilled it into me, gave me the means of accomplishing it, directed my work, and improved it very much after it left my hands." Mirabeau's *Lettres à un de ses amis en Allemagne, écrites durant les années 1786-90*, Brunswick, 1792, were addressed to Mauvillon, who published a German translation of them that same year.

Mauvillon also wrote several works on military science and history which, as remote from economic subjects, need not be noticed here.

[E. Leser, art. "Mauvillon" in the *Allgemeine Deutsche Biographie.*—W. Roscher, *Geschichte der Nationalokonomie in Deutschland* (History of National Economics in Germany).—Coquelin and Guillaumin, *Dictionnaire de l'Economie Polt tique*, art. "Mauvillon."] A. O.

[1] Du Pont has generally been regarded in economic literature as the originator of the expression "Physiocracy." In my edition of the *Oeuvres de Quesnay*, (Frankfurt A. M., 1888), I have, at p. 696 note, shown that this expression occurs half a year before the publication of Du Pont's work, in the *Ephémérides du Citoyen*, and indeed in an essay by the Abbé BAUDEAU. As QUESNAY had, as editor, assisted in arranging the title-page of the *Physiocracy*, in which his writings are collected, I believed the authorship of the word belonged to Quesnay, and all the more because Du Pont himself had never claimed it. A. O.

MAXIMUM. See REVOLUTION, FRENCH.

MAXIMUM SATISFACTION is the object towards which the economic man strives; the MARGIN, which constitutes economic equilibrium. A great part of economic theory may be regarded as a statement of the conditions of maximum satisfaction (cp. Marshall's *Principles*, mathematical appendix, note xiv.). Thus the theory of market price—that the demand at that price should equal the supply at it (Mill, bk. iii. ch. 2)—may be deduced as the condition of the price for which the satisfaction of the buyers and sellers should be a maximum.

It is understood that this maximum is subject, or—as the mathematicians say, *relative*—to certain limitations. Thus, in a market, it is assumed that property passes only by exchange. It is not denied that an equalisation of property would—abstracting ulterior consequences—be productive of a greater sum total of utility than is produced by the play of the market under a regime of unequal property (Sidgwick's *Pol. Econ.*, bk. iii. ch. vii.; Jevons's *Theory*, 2nd ed. p. 153; Marshall's *Principles*, bk. v. ch. xiii.).

It should be understood also that the *maximum* value of a function (see FUNCTIONS) is not necessarily the greatest possible value, but only the greatest of all values in the neighbourhood—a peak, but not the summit. There may be more *maxima* than one; and one *maximum* may be greater than another (Marshall, *loc. cit.* note). Accordingly, while it is true that any disturbance by which trade is shifted from an equilibrium to a neighbouring position, causes a diminution in the sum total of utility, it is also true that a disturbance, by which trade is shifted to the neighbourhood of a new equilibrium, may cause an increase in the sum total of utility. The latter kind of change is apt to occur when, by a stimulus to increased production, the advantages of production on a large scale are secured. Now it is quite conceivable that such a stimulus should be given by governmental interposition. Thus, while it is right to hold with Messrs. Auspitz and Lieben (*Theorie der Preise*, p. 425) and the classical economists, that a bounty causes a diminution in the sum total of utility, the organisation of industry being supposed unchanged; it is also right to hold with Professor Marshall that bounty, by bringing about a re-organisation of industry, may cause an increase in the sum total of utility.

Altogether, the doctrine that maximum satisfaction, or the greatest general good, is attained by exchange free from government intervention, is theoretically true in a much narrower sense than has been supposed by many publicists, and even by some theoretical economists. Its validity as a handy rule for practice is not denied.

[There is implied in the preceding argument a certain conception, which it is impossible here to express fully, concerning the modification of the law of supply—or SUPPLY-CURVES—which is involved in a re-organisation of industry, consequent on an enlarged scale of production. The view expressed on this subject by Mr. H. Cunynghame in the *Economic Journal* for March 1892 may be compared with the view expressed by Professor Edgeworth in the *Econ. Journal*, vol. iv. p. 436, and vol. xv. p. 62. In his *Mathematical Psychics*, he has pointed out analogies between the principle of maximum utility in economics and the principle of maximum energy in physics.] F. Y. E.

MAYOR, the annually-elected chief magistrate of a corporate town in England.

At the date of Domesday Book towns were governed by a *præpositus*, or reeve, and in many the payments due from the inhabitants to the king had been commuted for a fixed annual amount, the *firma burgi*, but there was, as yet, no municipal organisation unless the claims of London, set forth in the *Statement* addressed by the corporation to the city of London commission (1893), are historically valid. Under Henry I., however, London obtained by charter the election of its own sheriff, perhaps in place of the portreeve, and, in 1191, the citizens extorted the recognition of the *communa* they had long been trying to gain. This implied complete municipal self-government under a mayor, to the exclusion of all royal officers except the judges; but the *communa* must not be confounded with the merchant gild, from which it is essentially distinct in idea, though Glanville, in one passage, seems to treat the two as convertible terms. Indeed, it cannot be proved that London ever had a *gilda mercatoria*.

Henry Fitz-Alwyn, the first mayor of London, showed, in the affair of William Fitz-Osbert, that a corporation was not, in any modern sense, the champion of liberty; and in the year 1200, by purchasing a charter for the abolition of the ancient weavers' gild, the new municipality manifested a determination to control, without a rival, the trade and manufactures of the city.

The mayoralty of London is typical of the office in all other places, the charters of provincial towns frequently containing direct references to the customs of London as a standard. Some towns were allowed to have mayors at an early date—Leicester, for example, in 1208, but Norwich had no mayor until 1402.

The *Liber de Antiquis Legibus* assigns the date 1189 for Fitz-Alwyn's mayoralty, but not being a contemporary authority, its evidence must yield to that of Richard of Devizes and Benedict of Peterborough, who fix the year 1191 for the *communa*. Fitz-Alwyn held the office for life, and, in 1215, two years after his death, the king granted to the city the right of electing the mayor annually; but many of the subsequent mayors served for four or more years.

The customs of London were confirmed by

the 13th article of Magna Charta, and the high position of the mayor is shown by the fact that the *major de Lundoniis* was one of the twenty-five barons charged with carrying out the provisions of the charter.

A mediæval mayor played an active part in regulating the trade of his town. All questions arising from contracts between merchants, and all matters relating to apprentices, came before him, and he enforced the assize of measures, and the ASSIZE OF BREAD AND BEER. Wine, also, was tested by his authority, and the price of it might be fixed by his directions. All matters, too, relating to breaches of the regulations of the craft gilds were determined by him, and he thus gained a controlling influence over manufactures.

But more direct methods were not wanting, by which the mayor, with the advice, of course, of his council, settled matters which would now be left to the free bargaining of the parties concerned, and the *Liber Albus* of London may be consulted to show (pp. 289, 711, 712) that there was no hesitation about fixing the prices of meat, poultry, and fish, or the wages of carpenters, masons, and other workmen within the city, while on p. 418 of the same record may be read a document which is nothing less than a commercial treaty with Amiens and other towns.

An excellent idea of the position of a mayor in a provincial manufacturing town may be obtained from Blomefield's *History of Norfolk* (Norwich volume).

The history of the London mayoralty, from the reign of John, is the history of London itself, for which vast materials may be found in the records already quoted, and in the *Statutes of the Realm*. The mayor of London is supposed to have been first styled *Lord Mayor* in 1354, when the fourth charter of Edward III. gave him the honour of having gold or silver maces. He is summoned to sit and sign with the privy council the proclamation of a new sovereign. The mayor of Dublin, first appointed in 1409, was styled Lord Mayor by Charles II. in 1665, and the mayor of York has also for some time been entitled to the same special dignity, which has also been conferred on the mayors of Belfast, Birmingham, Liverpool, Manchester, Bristol, Leeds, and other great cities.

Mayors are now elected under the Municipal Corporations Act of 1882, 45 & 46 Vict. c. 50, from among "the aldermen, or councillors, or persons qualified to be such," on the 9th of November in each year, but the lord mayor of London is elected by the liverymen from the number of aldermen, the city of London not coming under the provisions of the above-mentioned statute. The chief functions of a modern mayor are to preside over the meetings of the council, to act as a justice of the peace for the borough, to act as returning officer at parliamentary and municipal elections, and to revise, with the aid of two assessors, the burgess lists when the borough is not represented in parliament.

[A. Pulling, *Laws, Customs, etc., of London*, 1854.—W. Maitland, *Hist. of London*, 1756.—Stubbs, *Constit. Hist.* and *Select Charters*.—James Thompson, *Essay on Eng. Municipal Hist.*, 1867.—H. A. Merewether, *Hist. of Boroughs*, London, 1835.—*Liber de Antiquis Legibus*, Camden Soc., 1846.—*Liber Albus* (*Munimenta Gildhallæ Londoniensis*, Rolls series).] R. H.

MEAN* is generally used in the same sense as AVERAGE. Some statisticians restrict the term to that species of average which is the centre of a group fulfilling the Law of Error (see ERROR, LAW OF). F. Y. E.

MEAN AFTERLIFETIME. This word was proposed by Dr. W. FARR (*q.v.*) to express what is often called the EXPECTATION OF LIFE, *i.e.* the calculated length of time that persons, in the aggregate, live. "The idea intended to be expressed by 'expectation of life' is the mean time which a number of persons at any moment of age will live after that moment: it is the French *vie moyenne*. And this technical idea is strictly and shortly expressed by *afterlifetime*, a pure English word, formed on the same analogy as *afterlife*." W. Farr, *Vital Statistics*, p. 478.

MEAN, ARITHMETICAL. See AVERAGE.

MEAN PRICES. See PRICES.

MEANS, METHOD OF. The method of means or averages is mainly directed to two purposes: (1) to ascertain an objective quantity, such as the stature of a certain man, by taking the mean of several fallible observations; (2) to find a so-called "subjective mean," such as the stature of the "mean man" (Quetelet) which may represent or typify the members of a species. Of these problems the latter kind is more frequent in the statistics with which political economy is concerned.

[See AVERAGE, and the references given under that head.] F. Y. E.

MEASURE OF VALUE. See STANDARD.

MEASURES AND WEIGHTS. The measures and weights here dealt with are those which were in use in this country during the five centuries after the Norman conquest. At the beginning of that period the various systems were beginning to emerge from a state of chaos, at the end they were, except for scientific definition, almost the same as now. During this time the units, which were destined to survive, were standardised; statute after statute was promulgated, ordering standards to be kept in various places for reference, and officers were appointed to examine and condemn false weights and measures. The immediate object of these acts was mainly fiscal, namely the prevention of the frauds on the customs revenue which were perpetrated by skilfully varying the size

of the customary measures. As an instance of this fraud may be quoted the chaldron of sea-coal which grew enormously in size through the imposition of a duty on each chaldron landed.

Some commodities were sold by number, and here it must be remembered that our ancestors counted by the score, not the hundred, the latter not meaning necessarily 5 score, but 5 score and 8, 5 score and 12, or 6 score, according to the locality and the nature of the articles enumerated. A thousand being 10 hundreds, might be and sometimes was 1200. A dicker was 10, a dozen generally 12, but a dozen of iron was 6 pieces; a bind of eels 10 sticks of 25 each; a bind of skins 30 timbres of 10 each; a hundred of garlics 15 ropes of 15 each; but a hundred of most things was 6 score, of horse shoes 5 score; a cade of red herrings was 6 hundreds, each of 6 score; a last of herrings 20 thousands.

Linear and area measures have not altered much since the 13th century. The table contained in *De admensuratione terræ* printed among the *Statutes of the Realm* as of uncertain date, but probably compiled about A.D. 1300, is, except for the omission of the land chains, exactly the same as our modern long measure and area measure. At the time of the compilation of Domesday Book, however, and for a considerable time after, the area of the acre seems to have varied locally, but the acre, rod, and furlong, although originally independent units, were already definitely related to each other; the length of the ordinary field in the direction of the furrows being a furlong, a field a rod wide was called a rod or rood and four roods made an acre. The yard at this time was not looked upon as a subdivision of the furlong, but was merely a cloth measure. The Roman measures—the mile, and the foot with its subdivisions, were unknown; the measure for long distances was the leuca of 12 quarentines or furlongs, which, however, in Domesday book was only used for measuring woodland. The two other Domesday units of land measurements, the HIDE and the carucate (see CARUCAGE), have long puzzled antiquaries. The hide seems to have been a unit for the assessment of taxation, not a true measure, although a hundred years later in the *Dialogus de Scaccario* it was stated to be 100 acres. The carucate was as much land as required one plough team, the bovate or oxgang being the share attributed to each beast, an eighth of a carucate if eight oxen made a team. These two units soon lost their meaning and became obsolete, the carucate first, the hide after. The first recorded attempt at standardising was that of Henry I. who ordered that the *ulna* or yard, hence called *ulna regis*, should be as long as his own arm. His example was followed by Richard I. and John, who caused standard yards to be made of iron. This yard was not the cloth yard, which does not seem to have been legally determined till the 14th century. Of miscellaneous measures of length and area may be mentioned—the solanda or double hide; solium, about 120 acres; virga or customary yard; tey, toise, or fathom of two yards.

The standard weight from the conquest till the time of Henry VIII. was troy weight. The troy pound seems to have been an arbitrary standard, although attempts were made to base it upon the weight of a grain of corn, by defining the pennyweight as the weight of 24 grains of wheat, and when it was found that this was not true, altering the number to 32. An old weight called the auncel was abolished by the statute of 25 Edward III. Although the legal pound was the troy pound, the merchants of the 15th century seem to have preferred a pound of 16 ounces; this pound was finally legalised by the act 24 Henry VIII. c. 3, where it is called *haber de payes;* it had already superseded the troy pound for most practical purposes. The most important table of weights in the middle ages was the wool weight.

7 lb. = 1 clove or nail, sometimes called great pound.	13 stone = 1 pocket or sarpler.
14 lb. = 1 stone.	16 stone = 1 pack.
2 stone = 1 tod.	26 stone = 1 sack.
12 stone = 1 wey.	12 sacks = 1 last.

A load varied from 168 to 175 stone. Although this was the table ultimately established by law, it was actually subject to great local variations. The clove or nail was often 8 lb. The stone varied locally from 7 lb. to 20 lb., and a long string of statutes did not succeed in making it uniform. The same remark applies to the sack. A weight called *pondus* was sometimes used and seems to have been about 20 lb.

For butter—

3 lb. = 1 quart.
2 quarts = 1 pottle.
7 or 8 lb. = 1 clove.
14 lb. = 1 pot.
56 lb. = 1 firkin.
112 lb. = 1 kilderkin.

The stone or petra of lead was 14 lb.

5 stone made a pig, pes, formel, fodmael or fontinellus.

30 pigs made a charrus, carecta, or plaustrata, which weight, however, seems not to have been distinguished from the fother of 19 hundreds of 108 lb. each.

The following were the most common miscellaneous weights.

The bundle or garb of steel contained 30 pieces, and 25 pieces made a hundred of 108 lb., the bundle was also used for vetches, etc.

Mark of gold or silver = $\frac{2}{3}$ of a troy pound.

Quintal of iron contained from 96 lb. to 120 lb.

Seem or sum of glass was 20 stone of 5 lb. each.

Wey of cheese was by statute 224 lb., but varied locally from 168 lb., *i.e.* 6 quarters, to 300 lb

Wey of barley, malt, or tallow was 6 quarters or 108 lb.
Wey of salt, 25 quarters.

The table of corn measures which can be drawn up from 14th century accounts is identical with that now in use. There was, however, in use till the reign of Edward III. a bushel of 9 gallons (or 2145 oz.), which only became obsolete after being declared illegal by numerous statutes. The first attempt to combine weights and measures into one system seems to have been made by the act of 12 Henry VII. c. 5 which declared that the gallon of wheat was to contain 8 lb. troy. There were a great number of customary dry measures; the following list omits those of which the name only is known.

Boll = 6 bushels.
Butt of salmon = 84 gallons.
Cade of tar = 12 gallons.
Celdra or chaldron of sea-coal or oats = 4½ quarters, but the coal chaldron varied considerably at different dates.
Cipha or sieve = about 5 quarters.
Coomb of east coast or ring of Huntingdonshire = ½ quarter.
Crannock (Irish) of oats = 16 bushels.
Last = 80 bushels of corn or 12 barrels of fish.
Load, seem, or sum = 6 or 8 bushels, or 12 trugg, but a sum of oats was 24 trugg or 2 quarters.
Mitta or met of salt = 2 bushels.
Pottle of butter = 2 quarts (*v.s.* under weights).
Strike = ⅛ quarter.
Windle of nuts, a Cumberland measure, was a bushel.

A measure called "water-measure" was in use in the 15th century containing 5 pecks; it was originally legalised for use on board ship, and continued to be used for fruit till modern times.

The liquid measures did not become important till the development of the wine trade in the 14th and 15th centuries, when a great number of strange measures were introduced from abroad. The barrel was a very variable quantity, almost every liquid having a different standard. The following wine measures were defined by statutes 2 Henry VI. c. 14, Richard III. c. 13, and 23 Henry VIII., viz.: tun, 252 gallons; pipe or butt of Malmsey, 126; tertian or puncheon, 84; hogshead, 63; tierce, 41; barrel, 31½; and runlet, 18½ gallons.

It must be remembered that, in dealing with any set of mediæval accounts, the equivalent of the various weights and measures given above must only be used as a rough approximation, to be verified or corrected by collating a number of accounts of the same place and date.

A. E. S.

MECHANICS OF INDUSTRY. Just as all the physical sciences have their basis in the general principles of the abstract science of statical mechanics—the same primary laws of motion governing phenomena, whether of solids, liquids, or gases—so, according to JEVONS, does the structure of economic science, in all its branches, rest on an abstract theory of political economy, which concerns itself only with general laws, simple in nature, and deeply grounded in the constitution of man and the outer world, and which he designates "the mechanics of self-interest and utility" (*Theory of Political Economy*, 2nd ed. 1879, pref. xvii.-xviii., p. 23; art. on "The Future of Political Economy" in *Fortnightly Review*, November 1876, vol. xx. N.S., pp. 624-626). This, he says, "is entirely based on a calculus of pleasure and pain" (*Theory*, p. 25; cp. pref. vii.). For just as the theory of statics rests on "the equality of indefinitely small amounts of energy," so here economic phenomena are "explained by the consideration of indefinitely small amounts of pleasure and pain" (*ib. loc. cit.*); and the laws of exchange-value "are found to resemble the laws of equilibrium of a lever as determined by the principle of virtual velocities" (*ib. loc. cit.*, also ch. iv., see EQUILIBRIUM). Similarly, in the work of Professor Marshall (*Principles of Economics*, vol. i. 5th ed. 1907,) in which VALUE (*q.v.*) is recognised as the central idea in economics, the whole structure is at once seen to rest on the balancing of indefinitely small increments of utility against the corresponding increments of disutility (see DISCOMMODITY; FINAL DEGREE OF UTILITY). Still the theory of UTILITY, which results from the conception of "a calculus of pleasure and pain," is, as Dr. Keynes insists, rightly to be regarded as an essential premiss rather than as an integral portion of economic science (cp. *Scope and Method of Political Economy*, 1904, p. 91. n.). A. B. C.

Dr. Irving Fisher in his *Mathematical Investigations in the Theory of Value and Prices*, has a good chapter on "Mechanical Analogies." Of these the most essential appears to be the analogy between mechanical equilibrium considered as a position of maximum energy, "where the impelling and resisting forces along each axis will be equal," and economic equilibrium considered as a position of maximum TOTAL UTILITY, "where the marginal utility and marginal disutility along each axis [each branch of production or consumption] will be equal." So in Prof. Edgeworth's *Mathematical Psychics*, pt. i. § 2, there is considered the analogy between the first principles of economics and "those principles of maximum energy which are among the highest generalisations of physics, and in virtue of which mathematical

reasoning is applicable to physical phenomena quite as complex as human life." Professor Marshall too has indicated that all the conditions of economic equilibrium may be comprehended in the one condition that the total utility or net advantages should be a maximum (*Principles of Economics*, Mathematical Appendix, 2nd ed., note xiv.). But in his third edition (*ibid.* note xiii.) he appears to shrink from the wider applications of this principle to "every field of economics." . . . "Such discussions have their place, but not in a treatise like the present" (*ibid.* 5th ed. notes xiii. and xiv.).

MEDIA ANATA, a tax of 50 per cent on the amount of their salary, which, from the time of Philip IV., was levied on all Spanish officials during the first year of their appointment. E. Ca.

MEDIÆVAL FAIRS. The great continental fairs are one of the prominent characteristics of mediæval mercantile life, and the part they took in the development of international commerce and mercantile law is of conspicuous importance. Their origin must be ascribed to the great religious festivals which attracted large numbers of people to certain places at fixed periods, and therefore created exceptional opportunities for mercantile intercourse; this explains their names ("fair" and "foire"—derived from "ferial"; "messe" = "mass"), and also the special protection which was given to their frequenters. The records of some of them, as, for instance, the fair of St. Denis in Paris, go back to the 7th century, but the time of their fullest development is reached in the 12th century, when the six fairs of the Champagne country were successively held at Provins, Troyes, Bar, and Lagny, at periods extending over the whole year, and were frequented by merchants coming from France, Italy, Spain, Savoy, and Switzerland, Flanders and Brabant, England and Germany. These merchants enjoyed numerous privileges; they were under the protection of the counts of Champagne, not only while they were taking part in the fair, but also on their way to the same, and on their homeward journey (*conductus nundinarum*), which, at a time when the plundering of traders was a regular source of income for the noble inhabitants of the castles near which their roads passed, was a considerable advantage, and they could not be arrested for debts previously incurred. On the other hand, claims arising from debts incurred at the fair were specially privileged both as regards procedure and priority.

A special "fair" tribunal was established, which had exclusive jurisdiction in respect of all transactions entered into at the fair, and in the case of persons returning to their houses without paying their debts, had power to issue a writ requiring the court of the place in which the defaulter was resident, to proceed against him. If such requisition was not complied with, the city or country to which the court belonged was placed under "interdict," which involved an exclusion of all its citizens from the privileges of the fair.

Being the great international meeting-places, these fairs offered exceptional opportunities for all money-changing transactions; and on the other hand, the coins issued in Champagne were largely used for international payments; hence the expression "troy" weight = weight of Troyes.

Promissory notes and bills of exchange payable at the fairs were convenient remittances in all mercantile countries, and the bankers who frequented the fairs seem to have established a regular system of clearing among themselves. Thus it was that not only through the interchange of goods, but also through personal contact, a feeling of community of interests was established among traders of all nations which could not fail to have a civilising influence in all countries. A uniformity of prices and mercantile customs was established to the great advantage of the general public, and the facility for the enforcement of debts and mercantile engagements generally by means of the extensive powers of a central tribunal, fostered trade by diminishing its risks.

Through local causes, the fairs of the Champagne began to decay in the middle of the 14th century, and some time afterwards those of Lyons began to assume an increased importance, which reached its climax in the 17th century. At the same time the fairs in Germany, especially the one at Frankfort-on-the-Main, began to develop, without however at any time attaining the international importance of the French ones. The Leipzig fair obtained pre-eminence in the 18th, and had great importance throughout the 19th century, but it has now ceased to exercise any material influence. The great fair of Nijni Novgorod in Russia is likewise failing.

[The information given above is mostly derived from Goldschmidt, *Universalgeschichte des Handelsrechts*, a book full of interesting economical information. See also the numerous authorities quoted by Goldschmidt, especially:—Bourquelot, *Études sur les foires de Champagne;* see also Dr. Rathgen's article: *Märkte und Messen* in Conrad's *Handwörterbuch*, and the authorities mentioned therein; article "Foire," by Turgot, in *Encyclopédie* of Diderot and D'Alembert; see also Market.]

E. S.

MEDICI, The. Though Florence was long shut out from unrestricted access to the sea, her trade and industry early exceeded those of towns such as Pisa and Lucca, which had the command of ports. The feudal aristocracy was overthrown by the industrial classes; the nobles were compelled to live within the walls and to submit to republican rule; and their repeated

attempts to recover their former ascendency never succeeded for any length of time. The commonwealth rested essentially on commerce and the arts. The population, for political as for other purposes, was regimented in trade gilds; associations of this kind had long existed, but they received their definitive organisation only in the latter part of the 13th century. Their number, after several changes, was fixed at twenty-one—seven greater and fourteen lesser. The most important industries were represented by the greater gilds, especially by the cloth-weavers, or Calimala,[1] the silk-weavers, and the money-changers. The wools of Italy were coarse, from the neglected condition of pasturage, as of agriculture generally; and the cloth-weavers imported wool from France, Flanders, Spain, and Portugal, England, and Scotland. The manufacturers of the Calimala were forbidden by statute to deal in home-made cloths; they imported the foreign fabrics made from the finer wools of Flanders, Holland, and Brabant; these they dyed and dressed, and then sold, at first in Italy and the East, and at a later period in France and England, and even in the countries from which, in the undressed state, they had been brought. Many of these manufacturers were members of distinguished families whose names often recur in the history of Florence. The silk-weavers were already numerous in the early part of the 13th century, and rose to greater importance when the cloth manufacture declined in consequence of the growth of the corresponding crafts amongst the Flemish, French, and English, which sought to exclude the Italian wares. But money-changing was the business which was the chief source of the wealth of the city. The origin of bills of exchange, placed in 1199, has been attributed to the Florentines; the commerce of Florence at least greatly extended their use. Banking was more flourishing there than in any other centre at the opening of the 13th century. In that century the Florentines had monetary dealings with Henry III. of England, and conducted the financial affairs of the holy see, which they long continued to manage to their great profit. Notwithstanding several reverses, arising from the action of the French and English sovereigns, the Florentine banks were numerous and powerful at the beginning of the 15th century. The Medici, the Bardi, the Acciajuoli, the Buonacorsi, and other great Florentine houses, had agents or branch establishments in London, Bruges, Paris, Lyons, Avignon, and Marseilles, besides those at Rome, Genoa, and Naples. In 1422 seventy-two exchange houses and tables are said to have existed at Florence in the *Mercato Nuovo* or its vicinity. The Florentine merchants of the period were notable, not merely for ability as men of business, but for personal dignity, public spirit, munificence, and patronage of art, to a degree not equalled by those of any other country; and of this combination of qualities several of the Medici presented eminent examples.

The Medici family first appears about the end of the 12th century. Giovanni de' Medici was a leader of an armed expedition of Florentines in 1251, and another member of the family took part in the expulsion of Walter de Brienne in 1342. They put themselves at the head of the *popolani grassi*, or superior trading classes, composing the greater gilds, who wrested the supremacy from the nobles in 1344. But the founders of the greatness of the family were Salvestro, and Giovanni surnamed di Bicci. Salvestro, who was gonfalonier in 1378, led a popular movement against the tyranny and proscriptions of the Albizzi. His son Veri was averse to public life, and devoted himself to commerce, which had already enriched the family. The defence of popular interests against the aristocracy became the hereditary policy of the Medici, and was effectively maintained by Giovanni di Bicci, who belonged to a different branch from Salvestro. Born in 1360, he inherited great wealth from his father Averardo, which he increased by his own ability, diligence, and prudence. In the register of property, 1427-1430, for purposes of taxation, Giovanni was second in the list of contributors. He had business relations, not only with the other Italian states, but with France and Flanders. All the great monetary affairs of Italy were transacted by him, notably those of Pope John XXIII. He expended largely from his private resources on public objects. As a politician his efforts were steadily directed to appeasing the enmities of classes and maintaining the internal peace of the republic. Giovanni's eldest son was Cosmo (1389-1464). He followed in the footsteps of his father. As a merchant he was skilful and successful. He had banks in all the countries of the west and was ruler of the European money-market. The agents who conducted his foreign speculations shared his prosperity; and hence, as Machiavelli informs us, originated many enormous fortunes in the hands of Florentines, as in the cases of the Tornabuoni, the Benci, the Portinari, and the Sassetti. His great profits from banking, trade, and farming, added to his inherited property, enabled him to spend large sums in the erection of churches and convents, as well as on his own household and social expenses, which latter, however, he restricted within prudent limits, thus avoiding public prejudice. The loans which he made to the state and to private citizens established his popularity, and, after his temporary fall and brief exile, were amongst the solid foundations of the power which he retained without interruption to the end of his life. He guided his political party amidst great difficulties with consummate skill, and conciliated opinion by his uniform courtesy

[1] "The term seems to have been taken from the name of the street in which the guild is situated. The street led to a house of ill-fame; hence the name *Callis Malus*, in the sense of *Via Mala*, evil road or lane."—*Villari*.

and his freedom from ostentation. Though practically the supreme director of the state, he assumed the manners rather of the first citizen of Florence than of its dictator. He did much for the furtherance of learning and art; and, on the whole, well deserved the title of *Pater Patriæ*, which by public decree was inscribed above his tomb.

Some members of the liberal school of the 19th century, who habitually exalted what they vaguely called liberty above good government, have spoken in a hostile, or at least a grudging, spirit, of the early Medici, because, from circumstances much less dependent on their personal efforts than on the condition of Florence in their times, the administration of the state came into their hands. But Voltaire has justly said that there never was a family whose power rested on more legitimate grounds, and it would be difficult to find, in the period to which he belonged, a nobler type than that of Cosmo.

His son Piero (1416-1469) was an excellent and highly esteemed citizen, but much inferior to his father in political acuteness and practical sagacity; and his grandson Lorenzo "the Magnificent" (1448-1492), though a brilliant and imposing figure, did not approach at all so nearly as Cosmo to the ideal of the chief of an industrial republic. As the Medici took more and more upon them the character of princes, they "forgot to be merchants." Their agents often neglected or mismanaged their affairs; and the commercial wealth of the family became completely dilapidated. Piero is thought to have seriously injured their political influence by demanding back loans which his father had made to many private persons—a proceeding which led to the insolvency of a number of merchants. But the failing resources of the Medici were largely supplemented out of the revenues of the state; and the republic, by diminishing the interest on the public debt and by other expedients, as Hallam says, "screened their bankruptcy by its own."

The later Medici cannot be followed here; they were no longer engaged in commerce, and in their political action did not rise above the other Italian rulers of their times.

[Machiavelli, *History of Florence.*—Guicciardini, *History of Florence.*—A. von Reumont, *Lorenzo de' Medici*, English translation by R. Harrison, 1876.—Pasquale Villari, *Two First Centuries of Florentine History*, English translation by Linda Villari, 1894.] J. K. I.

MEDINA, FRAY JUAN DE (lived towards the middle of the 16th century), was a Benedictine monk, and became the abbot of the monastery of this order in Salamanca. On the occasion of the regulations proposed by the government of Castile against the swarms of professional beggars who infested the country, a Dominican monk, fray Domingo de Soto, in his *Deliberatio in causa Pauperum* (Salamanca, 1545), had maintained their natural right to beg, and to pass from poor and destitute regions to other and richer parts of the monarchy. In his treatise entitled *De la órden que en algunos pueblos de España se ha puesto en la limosna para el remedio de los verdaderos pobres* (On the Regulation of Almsgiving for the Remedy of the Real Poor), also printed in Salamanca in 1545, by the same printer and reprinted in Valladolid in 1757 under the new title of *La Caridad discreta con los Mendigos*, Medina asserts the right and the obligation of the local authorities to provide for the wants of their own and honest poor, and to expel, without mercy, all shameless and able-bodied beggars strangers to the locality. "Justice must temper mercy, and almsgiving must be dealt with in an unambiguous way."

[The debate between the two reverend antagonists is very clearly summarised by Don Manuel Colmeiro in his *Hist. Ec. de España*, vol. ii. pp. 34-36.] E. Ca.

MEDIUM OF EXCHANGE. See MONEY.

MEDJIDIE. Two Turkish coins bear the name Medjidie (after the Sultan Abdul Medjid); the gold medjidie, or Turkish pound, and the silver 20-piastre piece. The gold medjidie, of 100 piastres, is a coin weighing 111·366 grains of gold of the millesimal fineness of 916·6, and is equivalent in sterling value to 18s. $0\frac{3}{4}$d. or to 22·78 francs of French standard gold, $\frac{9}{10}$ fine. The silver medjidie is a token coin weighing 371·22 grains, with a millesimal fineness of 830. F. E. A.

MEEK, Sir JAMES (1778-1856), was appointed in 1830 comptroller of the victualling and transport services at the admiralty. In 1841 he visited various foreign ports and cities to collect information as to the cost and supply of agricultural produce, etc. His report, which was printed by order of the House of Commons (*Parliamentary Papers*, House of Commons, 1842, vol. xl. No. 7), contained a mass of information, arranged in a tabulated form. It was of much service to Sir R. Peel in the preparation of his free-trade measure of 1846.

[*Dictionary of National Biography*, vol. xxxvii. p. 209.] H. E. E.

MEES, WILLEM CORNELIS (1813-85), was born at Rotterdam. He studied law at Utrecht, 1830-38, practised as a lawyer at Rotterdam (1838-47), where in 1843 he was also appointed secretary of the chamber of commerce. In 1849 he became secretary of the Netherland Bank, and 1863 president, which post he continued to hold until his death. Before he took his degree he wrote *Proeve eener Geschiedenis van het Bankwezen in Nederland* (History of the Banking System in Netherland), Rotterdam, 1838. His academical dissertation was entitled: *De vi mutatae monetae in solutionem pecuniae debitae.*

He also wrote the following works on economics:—*De Werkinrichtingen voor Armen uit een staathuishoudkundig oogpunt beschouwd* (The Workhouses for the Poor, from an Economic Point of View), 1844; *Het Muntwezen*

van Nederlandsch Indië (The Currency System of Dutch India), Amsterdam, 1851; *Overzecht van enige Hoofdstukken der Staathuishoudkunde* (Leading Chapters of Political Economy), Amsterdam, 1866. Of several speeches delivered in the Royal Academy of Sciences, the following are the most remarkable:—(*a*) *De Muntstandaard in verband met de pogingen tot invoering van eenheid van Munt* (The Standard of Currency, in Relation to the Efforts to Institute Unity of Currency); (*b*) *Opmerkingen omtrent gelijke verdeeling van Belasting* (Remarks on an Equal Division of Taxes); (*c*) *Poging tot verduidelijking van eenige begrippen in de Staathuishoudkunde* (An Attempt to give General Information on Political Economy).

Mees was essentially a man of science, and a very correct thinker on economical subjects. He generally agreed with the doctrines of Ricardo and Malthus. Intellectual and moral development was considered the best means for improving society. His *Chapters* is a very remarkable book, tending especially to set forth the connection between the rate of interest and the rate of wages, and the bearing of both on prices. The *History of Banking* is very complete.[1] He was a bimetallist by conviction; he advocated this system not only in his writings, but also at the Paris monetary conferences of 1867-68 as a delegate of the Dutch government. It may be claimed for him that he was one of the first who sought to place the doctrines of bimetallism on a scientific basis. As secretary and president of the Netherland Bank he gained great reputation; his management of that institution was greatly admired, and he largely contributed to its extension and improvement. A. F. v. L.

MEETING, Company. The Companies Act 1862 makes it obligatory for every company incorporated under its provisions (§ 49) to hold once a year at least a general meeting. Minutes of all resolutions and proceedings must be entered in the proper books (§ 67), and, under Companies Act 1900, § 12, a first (statutory) meeting must be held within a prescribed period. The articles usually provide for one general meeting to be held at a certain date each year, to be called the "ordinary" general meeting of the company, power being given to the directors and a certain number of shareholders to convene "extraordinary" special meetings. (See Table A., art. 29-34.) E. S.

MELANCHTHON, Philip (1497-1560), like Luther (*q.v.*) and the other Reformers, dealt freely and at length with the economic topics of the time in his sermons and other writings. In his general attitude, as we might expect, he resembled Luther; but his less passionate temperament, and his more scholastic learning show themselves in several matters. Especially was this the case in regard to the burning question of usury (see Interest and Usury). He follows the later canonists in approving of each of the three methods, and these in their most liberal form, by which a profitable investment was sought for capital,—the purchase of rent charges (*Census*, *Zinskauf*), partnership, and "interest" in its earlier sense. In the case of the last, while abiding by the old principles that the lender must lose a real opportunity of profit to have a just claim for recompense, and that the compensation must be reasonable, he took the decisive step of distinctly maintaining that compensation could justly be bargained for to run from the moment of the loan, and not simply on account of "Mora," or delay in repayment after an appointed time. See also Navarrus de Azpilcueta.

[Citations from his *Dissertatio de Contractibus*, and other works will be found in H. Wiskemann, *Darstellung* (1861), etc., and in G. Schmoller, *Zur Geschichte*, etc. (1861).—For an account in English see Ashley, *Economic History*, i. pt. ii. p. 457.] W. J. A.

MELON, Jean François (16——1738), born at Tulle, died at Paris. Originally practising as a lawyer at Bordeaux, he became in 1712 the paid secretary of a literary society, and then was appointed to the financial council established at Paris on the death of Louis XIV. He was then employed by D'Argenson and appointed inspector-general of *fermes* at Bordeaux. Afterwards he became the secretary of John Law, with whom he remained until the *Système* ceased to exist. Thence he passed into the service of the regent. At the death of the Duke of Orleans (1723) he returned to private life.

These successive occupations show a variety of ability which explains the welcome given by Melon's contemporaries to his *Essai politique sur le Commerce* (editions in 1734, 1736, 1742, 1761), and the influence he exercised in his time. The writings of Melon influenced Dutot (1738), and the writings of the latter gave the tone to Paris Duverney (1740). The "inside" account of the *système* of J. Law, which Melon gives, is important. He favoured slavery in the colonies, the mercantile system, and the balance of commerce; but he did not support a protective system as at present understood, and was aware that the interest of the consumer precedes that of the producer. He shows a mind which might have been favourably influenced by Quesnay and Adam Smith, had he lived half a century later.

Guillaumin's collection (*Économistes Financiers du XVIII^e siècle*, 1843) contains his *Essai politique sur le Commerce* as well as the *Réflexions politiques sur les Finances et le Commerce*.

[See reference to Melon—Hume, *Essays*, No. I., *on Commerce*—as to occupations of population in France, and in note Q, in which Melon's opinions are criticised. Turgot thought Melon eclipsed by Montesquieu and others, including Quesnay (*Œuvres*, ed. Daire, v. ii.] A. C. f.

[1] It clears up much on the history of the Netherlands Bank, misunderstood by A. Smith.

MEMORANDUM OF ASSOCIATION. Certain particulars respecting a company to be formed under the Companies Acts must be embodied in a document signed by at least seven members of the company, which document is called the memorandum of association. In the case of a company limited by shares, the required particulars are (1) the name of the proposed company; (2) a statement as to whether the registered office of the company is in England, Scotland, or Ireland; (3) the objects for which the company is to be established; (4) a declaration that the liability of the members is to be limited; (5) the amount of capital, and the number of shares into which it is to be divided. The directions as to the rights and duties of shareholders and directors, and as to the manner in which business is to be carried on, are generally given by a separate instrument, the name of which is "articles of association," but which, in the case of a company limited by shares and willing to abide by the regulations laid down by "Table A" (in the schedule to the act of 1862), is not required. A great difference between the memorandum and articles arises from the fact that the latter can at any time be altered by special resolutions, whilst the former cannot be altered even by the unanimous vote of the shareholders, except subject to certain conditions and restrictions. Before 1890 the only alteration which was permissible was an increase of the capital of a company limited by shares, but the Companies (Memorandum of Association) Act, 1890, provides that, subject to the consent of the court, and to the compliance with certain formalities, alterations, as regards the objects of the company, may be made if it appears that they are required in order to enable the company (*a*) to carry on its business more economically or more efficiently; (*b*) to attain its main purpose by new or improved means; (*c*) to enlarge or change the local area of its operations; (*d*) to carry on some business which may conveniently be combined with the former business; (*e*) to restrict or abandon any of the objects specified in the memorandum.

If any alterations are required which cannot be effected in the above-mentioned manner, a reconstruction of the company becomes necessary. [See PROSPECTUS, in App., Vol. III.]

E. S.

MENDICITY. Mendicity differs in character in different countries and at various times, but it everywhere embodies two ideas, viz. living at the cost of others, and wandering from place to place in search of the means of subsistence. In ancient Greece the mendicant was a familiar figure, he was tolerated if not encouraged, as witness the combat between Odysseus and Irus, for the post of "gaberlunzie" in Ithaca. In Rome mendicancy was common and was not forbidden by law, though in the later days of the empire repressive measures were adopted. The early days of Christianity were marked by an absence of the mendicant class, but it soon began to grow, and the laws of Justinian on the subject were necessitated by the halo of sanctity with which the church at times surrounded the beggar. In this country, the attitude of the ruling power towards mendicancy has varied greatly. The 14th century saw a series of acts passed, each more stringent than the last, on this subject. Sturdy beggars were to be put in the stocks, sent to gaol, and generally treated as a public nuisance, and with great wisdom the act of 1349 punished with imprisonment those who gave to such. But the law was almost powerless in the face of the encouragement which the beggar found at the religious houses throughout the country, and in the countless forms of indiscriminate charity. There is ground for thinking that mendicancy flourished during the 15th century, and it was only towards the middle and end of the 16th that measures against it were enforced, possibly in part owing to the sounder teaching of the reformers on the subject. Then we find Southampton ordering that beggars should have their hair cut, and parliament decreeing punishment in a progressive scale of severity. Whipping, branding, cutting off the gristle of the ear, even death, were the penalties assigned; whilst a loophole, so to say, was given by the provision which empowered the granting of licenses to beg. Lastly, in 1576 it was enacted that houses of correction should be provided in which the unemployed, who were generally vagrants, should be set to work. The end of the century saw a considerable abatement of the evil. From 1601 onwards the treatment of mendicancy has been a part of the general poor-law system of England. But the "rogue and vagabond" is the despair of the framers of acts for the relief of the poor, and dealing with settlement. Thus a consolidating act of 1713 lays it down that any person wandering about the country on any one of a long list of pretences is to be summarily arrested and removed to his settlement, or if he have none, to be dealt with by the poor-law authorities of the parish in which he is apprehended, but previously he may be flogged or set to hard labour, or committed for seven years to the custody of any person who will undertake to set him to work in Great Britain or the colonies. By the act of 1744 even women are to be flogged for vagrancy, and as late as 1824 flogging is retained as the appropriate punishment for "incorrigible rogues."

Under the new poor law of 1834 the vagrant was not distinguished from the ordinary pauper. Admission to a workhouse was a right enjoyed by all the destitute alike, with a corresponding freedom of discharge. Hence the vagrant found

in the workhouse a convenient and cheap resting place. This led to the provision of 1842, by which the guardians were empowered to prescribe a task of work to be done before he quitted the workhouse, and punishment for neglect to do it. By the act of 1871 he was to be detained till 11 o'clock, and if he reappeared at the same workhouse twice in a month, he was liable to detention till 9 A.M. on the third day after his admission. Special provision is now made for him in accommodation and diet. The number of casuals relieved on the night of July 1, 1905, was 8556. But mendicancy cannot be solved by act of Parliament. The legislature may provide for the treatment of "casuals," and make begging a crime, but such preventive measures will only be effective so far as they are supported by public opinion. The ordinary man feels compunction in "giving a beggar in charge," he has a certain sympathy with him, he lends a willing ear to his sad tale, he shirks the trouble of inquiry, he too often believes him. And so long as the demand for beggars in this shape continues, so long will the supply be forthcoming. Mendicancy takes many forms: the travelling hawker, duly furnished with a police license, the wandering musician, are in reality mendicants, for the sums they receive are out of all proportion to the services they render. The life of the mendicant has attractions of its own, as shown by the character of Edie Ochiltree in Scott's *Antiquary*, and the disinclination of mendicants to accept an offer of regular employment. Attempts to provide such employment are not wanting, they are seen in the work of the Salvation Army and the labour homes of the Church Army. In the same spirit philanthropists in Holland and Germany have founded INDUSTRIAL COLONIES (*q.v.*) in which vagrants may be gradually trained in the ways of regular and civilised living.

MENGOTTI, FRANCESCO (1749-1830). An economist and statistician, born near Feltre (Belluno). He was appointed in 1806 president of the general administration of finance in the Venetian provinces, and afterwards held the same post at Ancona; he was a senator in the first kingdom of Italy. When the Austrians returned into Italy, Mengotti became a councillor of the Venetian government, and vice-president of the board of taxation in Milan, where he died.

His best-known work is on *Commerce*, called by him "Colbertism" from COLBERT. This was a prize subject, set in 1791, by the "Accademia dei Georgofili" at Florence, and the prize was adjudged to Mengotti's paper. In this essay the writer endeavours to reconcile the MERCANTILE SYSTEM and the doctrines of the PHYSIOCRATS. He advocates free competition, and suggests the measures necessary for the adoption of free exchange. He, however, commits the error of attributing the origin of mercantilism to Colbert, who, while he frequently experimented in and applied its methods in France, was not its inventor. Mengotti's style is pleasing; his work had great success, and went through several editions.

Mengotti also wrote an essay (1787) on the commerce of the Romans, which obtained a prize at the Academy of Inscriptions in Paris. In this work the author maintains the theory that the Romans did not understand the importance of trade, that they thought only of enriching themselves with the spoils of every nation, and that their sole commerce was that of transporting into Italy all the riches of the countries they had conquered. Finally, Mengotti wrote a work on treasuries and public loans.

MENSARIUS. In a general sense *mensarius* (cp. *trapezita* in Plautus) means a banker or a money-changer, and if it was not originally the precise equivalent of *argentarius* (see ARGENTARII) it probably became so in the closing days of the Roman republic, for Suetonius (*Augustus*, 2 and 4) in one passage applies the term *argentarius* to the grandfather of Augustus, and in another describes him in the same sentence as *nummularius* and *mensarius*, two words which Festus shows are equivalent by explaining one by the other. But these words may conceivably have denoted different aspects of his business. Livy (vii. 21) supplies a safer clue in the passage: *quinqueviris creatis, quos mensarios ab dispensatione pecuniæ appellarunt;* and again, (xxvi. 36) *argentum, æs signatum, ad triumviros mensarios referamus.* From these words it appears probable that *mensarii* were bankers in

an especially public sense, and controlled the payments and loans made from public money; but the matter is one upon which opposite views have been held by scholars.

R. H.

MERCANTILE SYSTEM. By the mercantile system we mean the economic policy of Europe from the break-up of the mediæval organisation of industry and commerce to the dominance of the system of LAISSEZ-FAIRE (*q.v.*). Strictly speaking, there is only one country, viz. England, in which the mercantile system can be studied in all its phases. In other European countries the growth of the system of *laissez-faire* has been arrested, or a revival of mercantilism has taken place, from various causes, such as the creation of the German empire, and increased military expenditure. It is conceivable also that even so far as England is concerned there might be some return to mercantilist principles if a definite attempt were made to carry into effect a scheme of imperial federation. The object of the mercantile system was the creation of an industrial and commercial state in which, by encouragement or restraint imposed by the sovereign authority, private and sectional interests should be made to promote national strength and independence. Writers of the mercantilist school regarded political economy as a branch of the science of statesmanship, and, unlike the early advocates of *laissez-faire*, held that private interests did not necessarily, or even usually, coincide with the interests of the community. There are many points of resemblance between the mercantile system and state socialism (see SOCIALISM). An organised industrial and commercial state is an ideal common to both, and many of the measures adopted under the former would no doubt reappear if any considerable approach to the latter took place. But they differ in the ultimate end proposed. The object of the one was national self-sufficiency; of the other, it is the improvement of the lot of the wage-earners. The mercantile system involved regulation and control by the central authority, but not necessarily the imposition of protective duties. Thomas MUN (*q.v.*), its principal English exponent, admits cases in which free importation or exportation is desirable, and many of the early writers regard with great approval the "lowness of customs" imposed by the Dutch republic. Whether, on the principles of the mercantile system, a duty should be imposed or not, would depend upon the relation of the industry or trade concerned to the general economy of the nation. But in effecting their objects mercantilist statesmen did, as a matter of fact, find it necessary to invent a very elaborate system of DISCRIMINATING DUTIES (*q.v.*), and so long as the principles of the mercantile system were accepted, any considerable approach to freedom of trade was impossible. Adam SMITH makes the theory of the BALANCE OF TRADE (*q.v.*), as elaborated in MUN'S *England's Treasure by Foreign Trade* (1664), the central doctrine of the mercantile system. He represents that most of the restraints and prohibitions of that system were the result of its teaching, or of ideas to which Mun gave expression. But in the light of modern historical research it can scarcely be maintained that the mercantile system was merely the outcome of a failure to distinguish between wealth and money. Mun's work, all of which was written before 1628, though not published until 1664, taken together with the pamphlets of Edward MISSELDEN and other writers, no doubt gave to the mercantile system something in the nature of a theoretical economic basis, but the system was "established" long before the controversy on the balance of trade and the bullion policy of the EAST INDIA COMPANY. The NAVIGATION LAWS, the CORN LAWS, the acts for the encouragement of tillage, the statute of apprenticeship, the Elizabethan poor law, and other great measures which constitute the mercantile system (see APPRENTICESHIP, STATUTE OF; LEGISLATION, ELIZABETHAN), cannot be traced to the influence of any group of economic writers. They were the result of the efforts of statesmen so to direct the economic forces of their time as to create a strong and independent State. In Adam Smith's time the conditions which had really inspired the old regulations had practically disappeared. He made the mercantile system seem ridiculous by showing that it was based upon a mere popular fallacy. Apparently unconscious of the gulf between the 16th or the 17th century and his own time, he attacked the mercantilists because they had not fulfilled objects they had never had in view. His chapters are admirably designed for the demolition of an already undermined and tottering system of political economy, but they do not convey a true impression of the real character and aims of his opponents. His defence of the Navigation Act of the Long Parliament, and his distinction between productive and unproductive labour and consumption, transferred to the sphere of practical statesmanship, would afford a complete justification of the mercantile system.

It is impossible, within the narrow limits of an article, to give even a sketch of the rise, progress, and decay of the mercantile system, or to estimate its results. Only a brief indication of the general lines of development can be attempted. The influence of the system at any time depends upon a variety of circumstances,—the wealth of the country, the state of industry and commerce, the nature and the

extent of foreign trade, the degree of political consolidation, the strength of the sentiment of nationalism, the power of the central authority and its relation to local or municipal bodies. Some of the earlier phases of the movement can be usefully studied in the commercial and industrial policy of James I. of Aragon. In the case of Barcelona, as in that of England, mercantilism succeeded a policy of free trade. In England the efforts of Edward I. to bring the industry and commerce of the country under the control of the government, and Edward III.'s free trade policy, were followed by a mercantilist regime. During the 15th century the development of the system can be traced in the struggles and rivalries of the staplers, a mixed body of English merchants and foreigners, the Hanse merchants, and the merchant adventurers, and the trade regulations of Edward IV. (see ADVENTURERS, MERCHANTS; HANSE OF LONDON; STAPLE; etc.). By the end of the century the general features of the mercantile system are well defined.

The general character of the economic problems which English statesmen had to grapple with in the 16th century has been indicated in a former article (see ENGLISH EARLY ECONOMIC HISTORY). The result was the mercantile system as embodied in the legislation of Elizabeth (see LEGISLATION, ELIZABETHAN); the organisation of the trading companies (see TRADE, FOREIGN, REGULATION OF); and the NAVIGATION LAWS (*q.v.*). An instructive parallel may be drawn between the economic policy of England at this period and that of France, Sweden, and other European countries. Henri IV. "dressed a new plan of the French monarchy; and though his great designs were intercepted by an immature death, and also by a succeeding minority, yet the great Cardinal Richelieu resumed it again. He first taught France that the *fleur de luces* could flourish at sea as well as on land, and adorned the sterns of his new-built ships with this prophetic inscription, '*Florent quoque lilia ponto*'" (Sir Philip Medows). But it was not only in this direction, but in his general policy, that he acted in accordance with the principles of the mercantile system; while Cardinal Richelieu was still more active in the same direction. The history of the system during the 17th century is practically the history of the internal measures, and the trade and diplomatic relations of England, France, Holland, and Sweden. Cromwell in England, and Colbert in France, are generally regarded as typical mercantilist statesmen. But this is scarcely true of Cromwell, Strafford approaching much nearer the ideal. In the time of the Commonwealth and protectorate, unmistakable signs can be discovered of the break-up of mercantilism, and the approach of a period of *laissez-faire*, particularly in relation to the trading companies, the poor law, and certain industrial statutes; and by the end of the 17th century the decay of pure mercantilism was very marked. It is curious to notice how closely in this respect France and England kept pace with each other. The causes of the decay of the mercantile system have already been briefly indicated (see ENGLISH EARLY ECONOMIC HISTORY; FREE TRADE, EARLY HISTORY OF). It is necessary to observe, however, that economic policy was in certain directions in advance of economic theory. That nations should pass through a mercantilist "stage" seems inevitable. In the economic policy of the Great Elector, Frederick William (reigned 1640-1688), and Frederick the Great (reigned 1740-1786), features similar to those of England at an earlier date can be discerned. Though the theory of the balance of trade has disappeared, the policy of regulating industry and commerce with a view to national interests as distinct from those of the consumer is still prevalent throughout Europe and in the colonies. It cannot be said, therefore, that the mercantile system, in some of its essential characteristics, has by any means disappeared.

[Schmoller, *Mercantile System*, trans. by W. J. Ashley. Macmillan.] W. A. S. H.

MERCANTILISM. See MERCANTILE SYSTEM.

MERCERS. The early history of this craft is obscure. They seem to have been originally traders in small wares, and "mercer" and "merchant" were frequently used interchangeably. But the term soon came to be restricted to dealers in what is now called haberdashery; and during the 15th century silks and velvets became their main articles of trade.

In London the mercers rose to importance during the reign of Edward III. Like some other misteries, their first formal association was probably in the form of a religious fraternity; and such a "fraternity of mercers" is mentioned as early as 1321. In 1365 they contributed more than all, save three other London misteries, to the expenses of carrying on the war in France; in 1377, like eight other misteries, they elected six members of the common council. It was not, however, until 1393 that the men of the mistery of mercery of the city of London secured by the payment of a heavy fine letters patent from Richard II., licensing them "to have a perpetual community" with power to elect four wardens to regulate the craft. The reason assigned for the license shows not only that the community was still largely of a religious character, but also that the mercers of that date were no longer content to deal in goods imported by others, but were themselves beginning to engage in foreign trade. It sets forth that "several men of the mistery often by misfortunes of the sea and other unfortunate casualties had been impoverished . . . where-

fore the men of the mistery desired to ordain some certitude for the sustentation of such poor, as well as of a chaplain to celebrate divine offices." Among the most successful of the great merchants of the mercers' company was Sir Richard WHITTINGTON (lord mayor in 1398, 1407, and 1420), who appointed it by his will (1421) trustee of his college, almshouse, and other charities. The company had already, in 1393, received permission to hold lands to a certain value in mortmain; by letters patent in 1424 it was expressly given the right to have a common seal, and to sue and be sued as a corporate person. It was from among the mercers that the organisation of Merchant Adventurers (see ADVENTURERS, MERCHANTS), arose early in the 15th century; and the two bodies long remained closely connected. So rapidly did the wealth of the mercers and their corporate dignity increase that during the second half of the 15th century the mercers' company was frequently placed first among the London misteries on ceremonial occasions, and this precedence was definitely confirmed to it by an order of the court of aldermen in 4 Henry VIII. In 1511 and subsequent years, Dean Colet, the son of a mercer, made the company trustee for his newly-founded school at St. Paul's, and granted to it considerable estates for the purpose. It built for itself a hall and chapel during 1517-52. During the later Tudor reigns the company grew in wealth and importance; it shared in the reputation of its member Sir Thomas GRESHAM; and it contributed largely towards the provision of troops, the storing of the city granaries, and other public purposes. Its position in the economic history of the 17th century is rendered sufficiently evident by the facts that it was in Mercers' Hall that the Council of Trade held its meetings in 1660, that there the earliest operations of the Bank of England took place in 1694, and that there subscriptions were received for the United East India Company in 1698. By this time, however, the company had come to be dissociated from the occupation whose name it bore. The loss of its buildings in the great fire of 1666 seriously embarrassed its finances: to pay off its debts it engaged, in 1698, in a most unprofitable scheme of granting annuities, from the disastrous effects of which it was only enabled to recover by means of a lottery authorised by 4 George III. During the last century its income has been enormously increased by the falling-in of building-leases in London. The annual revenue in 1879-80 was £82,758 (corporate, £47,341; trust, £35,417); and the livery in 1892 numbered 185.

There arose mercers' companies during the 15th, 16th, and 17th centuries in most other important English towns. The statute of apprentices (5 Eliz. c. 4) placed the craft of the mercer next after that of the "merchant trafficking into any parts beyond the sea" in the list of those occupations for apprenticeship to which a larger than the ordinary property qualification was necessary on the part of the parents. In the curious unions of incongruous crafts which were effected in the 16th and still more in the 17th century, it was frequently the mercers who gave their name to the chief craft organisation in the town. The main purpose of these later organisations was to enforce the law of apprenticeship, and to exclude strangers from the industry and trade of the several towns.

[For the London Company, see W. Herbert, *History of the Twelve Great Livery Companies* (1834), vol. i., and W. C. Hazlitt, *The Livery Companies of the City of London* (1892).—For other English towns a list of references will be found in C. Gross, *Gild Merchant* (1890), i. 129 *n.* 1; 139 *n.* 2.—*The Laws of the Mercers Company of Lichfield* of 1623, transcribed by Mr. W. H. Russell, are printed in the *Trans. of the R. Hist. Soc.*, N. S., vii. (1893).] W. J. A.

MERCHANDIZE, MARKS ON. See TRADE MARKS.

MERCHANTABLENESS, IMPLIED WARRANTY OF. According to the civil law which is followed in many continental countries the seller of a thing is held to guarantee the buyer against any latent defect in it. But the general rule of English law is *caveat emptor*. The buyer is entitled to have the article he contracted for, but its quality and condition must be the subject of express stipulation. In modern times the tendency is to narrow the rule of *caveat emptor*, and a notable exception engrafted in it is the implied warranty of merchantableness. When goods are bought by description from a manufacturer or dealer, and the buyer has no opportunity of inspecting them before purchase, the law implies a warranty or condition that they shall be merchantable, that is to say, that they shall be reasonably fit for the purposes for which such goods are ordinarily used.

MERCHANTS.

Merchants, History of English, p. 729; Merchants, Alien, p. 731.

MERCHANTS, HISTORY OF ENGLISH. Before the conquest, as long after, the merchant united several functions which subsequently became differentiated. He was the owner, whether individually or as a partner with others (CANON LAW; PARTNERSHIP, CANONIST THEORY OF), both of the goods transported and of the vessel in which they were carried. "I enter *my* ship with

my merchandise and sell *my* things," says the merchant in Archbishop Ælfric's *Colloquium*. On the other side, the merchant vendor of ready-made articles was at first indistinguishable from the artisan, who was eligible to the gild merchant (see GILDS). The merchant shipowner was necessarily a man of considerable wealth, and by a law of Ina of the 8th century, every merchant who had made three voyages was "thaneworthy," even though by birth a serf. The enumeration, in the dialogue above referred to, of the articles imported, points to a southern trade for the most part. "What do you bring to us?" the English merchant is asked. He replies: "Skins, silks, costly gems, and gold, various garments, pigments, wine, oil, ivory and orichalcus, copper and tin, silver, glass, and such like." The metallic imports, excepting gold, were probably the fruit of a coasting trade with Cornwall; the skins from Scandinavia.

The Norman conquest and the military ideas which then became dominant repressed mercantile activity. Internally trade was hampered by local privileges and tolls; at the ports by excessive duties. But in the middle of the 13th century the creation of the STAPLE showed the importance which the kings were beginning to attach to the export of wool to the low countries, where it was manufactured into cloth, large quantities of which were imported into England. About the same time began the endless disputes between the kings and the corporation of London as to the rights of alien merchants, showing the influence which the English mercantile class was beginning to assert. To the same period belongs the statute of merchants (see LAW MERCHANT). The great development of this class dates, however, from a century later, and was due to a concurrence of various causes. The first was the successful rivalry of the staplers with the Italian exporters of wool, who were privileged to ship wool without paying staple dues, and who in return supplied the kings, especially Edward III., with money for the necessities of state. The second was the expulsion of the Jews (see JEWS, ECONOMIC POSITION AND INFLUENCE OF) in 1290, which had set free their hoarded wealth. Thirdly, the dissolution of the order of the Temple in 1308 (see TEMPLARS) set free large accumulations of capital during the twenty-six years which elapsed before the bulk of the Templars' property, though by no means all of it, was transferred from the crown to the Knights Hospitallers. Fourthly, the northern coal-trade and the manufacture and export of cloth, specially stimulated by the invitation of Flemish artisans to this country by Edward III., created the first wealthy class of manufacturers and the first wealthy class of exporters of finished goods. This class, represented in both branches by the Canynges of Bristol, sprang up with extraordinary rapidity, aided by the favouring circumstances already enumerated. Its rise suggested to Edward III. a means of disembarrassing himself of his Italian creditors, whose resources he had seriously drained, and whom he felt himself wholly unable to repay. In 1338 he made a proposal to the English merchants of the pre-emption of the 30,000 sacks of wool granted him as a subsidy. After pressure put upon them by the king and council, and by the Commons, a group of English speculators appears to have contracted for the wool upon conditions which, it may be inferred, were prejudicial to the Italians, who were in the same year generally arrested throughout the kingdom. In 1342 the merchants met in London, as a sort of sub-estate of the realm, and granted Edward III. a subsidy of 40s. a sack without consent of parliament. In requital they were gratified, in 1343, by the statutory raising of the price of wool, a policy possible to a country which enjoyed a monopoly. Two years later the king's creditors—the Bardi and Peruzzi—failed, and the English speculators assumed the title of "The King's Merchants," together with the financial functions which had for a time enriched their Italian rivals. They farmed the CUSTOM, large latitude being allowed to their impositions. They favoured the export of their own wools, and placed impediments in the way of those of their competitors. They farmed the SUBSIDIES (*q.v.*), buying the wools cheap and selling them, as the Commons complained in 1348, at a profit of 60 per cent. They acquired vast wealth as royal exchangers (see EXCHANGER, ROYAL) and as masters of the MINT, in which last capacity they were accused, in 1351, of malpractices with the coinage. They contracted for PURVEYANCE—buying provisions at nominal prices in the king's name, and reselling them at large profits,—for provisioning garrisons, and for raising troops, whose number and quality did not always tally with the muster roll. To this period belongs the rise of the great London trading companies, such as the pepperers or grocers, and drapers, and of the great capitalists, of whom the De la Poles and Whittington are the most notable. It is to be observed that Richard de la Pole, who belongs to a generation earlier, built up his fortune at the beginning of the reign of Edward III. by such contracts with the crown, while Whittington lent money on the security of subsidies. In 1406 to the merchants was entrusted the keeping of the sea, and one of their number, Nicholas Blackburn, was made admiral of the fleet.

After the Wars of the Roses the financial organisation of the kingdom was more complete, and transactions between the crown and its subjects were conducted through the agency of the two great mercantile societies of the staple and the merchant adventurers (see

ADVENTURERS, MERCHANTS; STAPLE), with one or both of which bodies eminent merchants, such as the Greshams, were as a rule associated. The internal tranquillity which followed upon the accession of Henry VII. was naturally advantageous to this class, and when public opinion became stirred, in the close of the 15th century, against the practice of inclosure, the "merchants, clothiers, and others," were attacked as engrossers of land and evictors. Even Thomas Cromwell, himself sprung from their ranks, contemplated an act in 1535, "That no merchant shall purchase more than £40 lands by the year." A bill to this effect, limiting the sum to £50, was actually introduced into parliament in 1559. These are evidences of the opulence of the class who, emulating the example of the De la Poles, extended their influence by aristocratic or, in the case of the Boleyns, even royal alliances.

During the decay of the staple under Henry VIII., and after its ruin on the capture of Calais under Mary, English mercantile enterprise availed itself of the new discoveries. The Thornes of Bristol made their way to the New World; Hawkins of Plymouth to Guinea and Brazil; Hore of London founded a colony in Newfoundland. These expeditions led to the formation of such trading companies as the RUSSIA; the TURKEY; the Guinea (see GUINEA TRADE); and the EAST INDIA and the VIRGINIA companies (see notices of these COMPANIES). It was through connection with these companies that the best known among the merchant princes of the 17th century gained their fortunes, such as Sir Thomas Smythe, Dudley NORTH, Sir Josiah CHILD, and Edward Colston of Bristol. The closing of the exchequer by Charles II. (EXCHEQUER, CLOSING OF THE) was an influential factor in determining the sympathies of the mercantile class towards the revolution, and it was to them that the foundation and success of the bank of England, a mainstay of William III.'s government, was due. The general diffusion of wealth during the 18th century, due to the development of manufacturing industry, caused the disappearance of the line of demarcation which down to that time had distinguished the merchants from other classes.

To sum up. The great age of English merchants was the 14th century, when they were enriched partly through extension of trade, but more especially through financial business with the crown. The second period of prosperity, associated with the staple and the merchant adventurers, lasted from the conclusion of the Wars of the Roses till towards the close of the reign of Henry VIII. The third began with the exploitation of the new discoveries by the great trading companies, and lasted till the Civil War. The fourth was due to the extension of trade with America and India during the close of the reign of Charles II. After this time great fortunes were amassed by the development of internal trade, the term merchant reverting to its ancient signification, and no longer necessarily bearing a connotation of foreign adventure.

Palgrave, *The Merchant and the Friar*, 1837, 2nd ed. 1844.] I. S. L.

MERCHANTS, ALIEN. Under the Anglo-Saxon kings and for two centuries after the conquest, the attitude of the English people and government towards aliens trading in this country was, as might be expected from the backward condition of our civilisation, one of suspicion and hostility. Safe conduct was at first granted to individuals, then to nationalities, as to the subjects of the emperor by Ethelred II. The reign of John was marked by an unprecedented liberality of treatment. Upon his accession John issued circular letters to his officials at the ports forbidding the oppression of alien merchants in the matter of tolls, and ordering that they should enjoy the same security as English merchants in their respective countries. Similar provisions were embodied in §§ 41, 42 of Magna Carta. These gave rise to long contention as to the meaning of the phrase *sine omnibus malis toltis* (see MALATOLTA), from which foreign traders were to be exempt, and which was eventually decided to include all duties not voted by parliament. With regard to the stipulation for freedom of trade, the interests of the chartered towns were opposed to those of the crown and aristocracy. London from the first led the opposition to aliens, and on this account supported the barons against Henry III., during whose reign extensive immigrations took place. The alien merchants, on the other hand, learnt to associate themselves in nationalities or cities and to conclude private treaties, promising reciprocity for such trading privileges as the citizens were disposed to concede to them. Such an arrangement was entered into with London by the merchants of Amiens, Corby, and Nesle in 1237. In 1267 the HANSE (see arts. on subject) established a factory in London, and soon afterwards the English a similar one in Danzig. But the normal policy of London was one of petty persecution of aliens. With the accession of Edward I. the system of reciprocity between towns was replaced by the control of the central government. Edward seized the city's charters and extended the trading privileges of the aliens. Upon the restoration of the privileges of London in 1298 a renewal of former repressive ordinances against foreigners took place. In 1303 Edward issued the Carta Mercatoria

in favour of foreign merchants. This is one of the most notable documents of English history. It had a national scope. It guaranteed personal safety to all foreign merchants. It allowed them to import all kinds of wares; to sell wholesale both to freemen of towns and to strangers, and to sell retail to all both spices and mercery. Authorities in towns and markets were to be attentive to their complaints and to administer justice according to the LAW MERCHANT. Alien merchants were entitled to demand mixed juries in trials between aliens and Englishmen, and a judge was specially appointed to take cognisance of cases in which they were concerned. They in return were to pay additional customs. All that was left of the exclusive privileges hitherto so jealously insisted upon by the towns was the retail trade. In 1311, under the feeble government of Edward II., the Londoners, with the assistance of the barons, procured a repeal of the articles of this charter as to residence and retail trading, and restricted the stay of foreign merchants to forty days. Although in 1322 Edward II. felt strong enough to restore the charter, a reaction in favour of the city set in with the accession of Edward III. The restrictions upon aliens' freedom of trade were renewed. The necessary consequence was a rise of prices, which led to the re-establishment of the aliens in their privileges. This was followed by a series of acts protecting aliens against unjust arrest for the debts of others, allowing them to make sales on board their ships, affording them an interval after the outbreak of war for the removal of their goods, accepting their own declarations as the basis of payment of customs, and exempting them from the exactions of royal purveyors. But the opposition of the city was persistent, and the tide again turned at the end of Edward III.'s reign. While Richard II.'s policy was wavering, Henry IV. cultivated the good-will of the city by large concessions, so that in 1406 the clothworkers and merchants of the country complained of exclusion from direct dealings with the foreigner. A relaxation was then made, allowing wholesale dealing between English and foreign merchants everywhere. Subject to this provision, the ascendency of the city was definitely established. The high water mark of protection against alien merchants was an act of 1439 (18 Hen. VI. c. 4). By this act trade among foreign merchants was prohibited; hosts were to be appointed with whom they should lodge, and who should supervise their contracts; a stay limited to eight months was allowed for the transaction of business, and goods were to be taken out in exchange for those imported, the object of which was to check an alleged depletion of gold. The effect of this rigorous act was to drive the foreign merchants from places where it was enforced into the country, where they embarked in the trade of export of wool. By an act of 1465, directed against the Italians, who were foremost in this business, executory contracts for the purchase of wool were forbidden (4 Ed. IV. c. 4). But foreign merchants profited from the struggle between the rival houses of York and Lancaster. The Italians generally supported the Lancastrians, and received concessions in the way of customs dues from Henry IV. Edward IV. leaned on the Hanse (see HANSE TOWNS), and in return for their aid in his restoration in 1471 concluded with them the Treaty of Utrecht (1475), conceding to them extensive privileges in England. With the object of gaining the favour of the commercial classes, Richard III. pursued the anti-Italian policy of his brother. The act of 1485 "touchinge the Marchauntes of Italy" (1 Ric. III. c. 9) restored many of the restrictions of the act of 1439 which had expired, but its effects were probably more felt in the country than in the towns, which protected themselves in their privileges by the sedulous enforcement of their customs. This perhaps accounts for the fact that Henry VII. ventured, immediately after his accession, to repeal the portions of Richard's act which affected Italian merchants (1 Hen. VII. c. 10), which he would scarcely have done had London been vitally interested in their maintenance. Possibly the Italians, who, as we know from the *Libelle of Englyshe Polycye*, were notorious for their skill in bribing the official classes, took advantage of Henry's financial difficulties and rendered a pecuniary equivalent for the restoration of their privileges. The country gentry also would favour concessions facilitating the operations of profitable customers. But three years later Henry revived the act of 1465 against executory purchases of wool (4 Hen. VII. c. 11). This act expired in 1499, and an interval of comparatively free trade followed accompanied by numerous immigrations and consequent dissatisfaction in London and other large towns. In 1514 the trading companies of the whole kingdom joined in a remonstrance to the king, and petitioned for a revival with increased stringency of the act of 1439. This petition proving ineffective, it was followed three years later by the riot long after known as "evil May day," directed, however, principally against foreign handicraftsmen. In 1523 the exclusive trading privileges of the city of London were invaded by an act permitting country clothiers to deal directly with foreign merchants (14 & 15 Hen. VIII. c. 1). Discontent was also expressed, as it had been by the parliaments of Edward IV. and Henry VII., at the exemptions from aliens' customs duties obtained by means of letters of naturalisation. In 1530 parliament laid down the principle that naturalised aliens should continue in future to pay aliens' dues (22 Hen. VIII. c.

8), which involved a large protective difference in favour of the English merchant. But a notable reversal of policy was effected by Cromwell in 1539, when by an exercise of high prerogative alien merchants were for a fixed period of seven years placed, as far as customs duties were concerned, upon the same level as Englishmen. Pursuing the same policy, while bidding for popular support by discouraging alien handicraftsmen, Cromwell, as Henry a century earlier, favoured alien merchants by suspending in their favour the execution of the act "concerning strangers" of 1540 (32 Hen. VIII. c. 16). This act revived that of 1483 (1 Ric. III. c. 9), which limited to eight months the time allowed to foreign merchants within which to dispose of their wares. But it was only enforced for the purpose of recruiting the treasury with the fees paid upon naturalisation. Upon the expiration of the proclaimed period in 1547, a return was made to the policy of differential duties on exports which were finally abolished by an act of 1672 (25 Car. II. c. 6). A collection of documents has been printed by Schanz, ranging from 1485 to the reign of Elizabeth, which set out the grievances of alien merchants. These may be classed under three heads—complaints against English commercial law, such as the navigation acts; against the customs, and against officials, whether of the crown or of the towns, especially of London. Among the first class of grievances were the prohibition to buy what were known as STAPLE wares except through the middleman, the stapler, and those forbidding the export of manufactures in an unfinished state, or of raw material, except at the cost of an expensive licence. It was also disadvantageous to the foreign importer to be compelled to take English goods in exchange, burdened with the enormous profits of the staplers, rather than to ship tin and hides from the warehouses of the Hanse. To enforce this regulation a vexatious system of demanding surety had been devised (5 Hen. IV. c. 9; 4 Ed. IV. c. 6). Against "Customers"[1] there were many complaints. An act of 1487 (3 Hen. VII. c. 7) provided that merchandise should be entered in the customers' books in the name of the true owner. This, until repealed by 1 Hen. VIII. c. 5, furnished numerous pretexts for confiscation. In 1530 an attempt was made to revive a statute of 1381, forbidding foreign merchants to transact business by letters of exchange without a royal licence. This was done to check the decline in English exports. The measure, opposed by GRESHAM, was only maintained *in terrorem*, a common policy of this period. Liberty of exchange was granted by proclamation in 1538.

Numerous complaints arose out of the multitudinous petty exactions levied under the pretext of local customs and tolls upon foreign merchants. Some four-and-twenty of these are enumerated. In the roadstead, at the port of unlading, in the market-places of the towns, upon lading the return cargo, upon clearing, upon entering at the customs, whether outwards or inwards, excuses were found for these demands. As English merchants, especially citizens of London and other chartered towns, were exempt from many of them, besides enjoying the advantage of differential customs, they were not unpopular in England, so far as they increased the protection enjoyed by native subjects. It was affirmed on the one side and denied on the other that these exactions had been multiplied during the first half of the 16th century. It is significant that the grievance of "going to host" had disappeared, that invention having been found to result in surreptitious partnerships between the foreign merchants and their hosts, in which they had secured the advantages intended to be reserved to Englishmen (cp. the "act for the trewe payment of the kinges customes," 1 Hen. VIII. c. 5). Resident alien merchants were made to contribute to the subsidies, a line of distinction being generally drawn by the subsidy acts between aliens in possession of property up to a certain value and those in receipt of wages.

The history of the relations of the English government to alien merchants during the 16th century shows the growing enterprise of English merchants and their dissatisfaction at the privileges enjoyed by favoured corporations, like the Hanse, or by individuals wealthy enough to purchase royal letters of licence (see LICENSES). With this national feeling the Tudor governments gradually associated themselves. With the disestablishment of the Hanse, begun under Edward VI. and practically completed under Elizabeth, the exceptional position of alien merchants in this country came to an end.

MERCHANTS' PETITION OF 1820, THE. A very able document, drawn up by T. TOOKE (*q.v.*), subscribed by all the most eminent merchants in London, and presented to the House of Commons in 1820 by Mr. Alexander Baring. The contents of its fifteen paragraphs may be thus summarised.

The end of foreign commerce is to import what can be best produced abroad, and to export, in payment, what can be best produced at home. This end can only be attained where there is freedom from restraint. The maxim, "to buy in the cheapest and to sell in the dearest market," applies to international

[1] Officers of customs, H. Hall, *Customs Rev. of England.*

transactions. Unhappily, a very different policy has prevailed, and "jealousy and hostility" have taken the place of "mutual benefit" and "harmony." The fallacy of the protectionists consists in supposing that imports from abroad tend to discourage home products, whereas they actively stimulate such industries as are in fact suitable to the importing country. This follows from the rule that exports must, in the long run, pay for imports. Protection seldom benefits the protected, and never to the extent of the loss occasioned to others. When once the road of protection is travelled, there is no halting, until all foreign commerce whatsoever is destroyed; indeed England might, with as good reason, demand protection against Scotland, or Scotland against England, and the different counties of each country against each other.

An inquiry would probably show a connection between a protective policy and the distress prevalent. A declaration in favour of free trade would carry weight abroad, where protectionists can point to the authority and example of England, and would tend to counteract the commercial hostility of foreign nations. Although a policy of RECIPROCITY (*q.v.*) may be defended, in particular cases, on diplomatic grounds, "it does not follow that we shall maintain our restrictions in cases where the desired concessions cannot be obtained. Our restrictions would not be the less prejudicial . . . because other governments persisted in preserving impolitic regulations." In any case "the recognition of a sound principle or standard" may be expected to have a salutary influence on other states. The petition does not complain of duties collected for purely revenue purposes. "It is against every restrictive regulation of trade, not essential to the revenue, against all duties merely protective from foreign competition, and the excess of such duties as are partly for the purpose of revenue, and partly for that of protection" that its prayer is addressed.

The language, as to reciprocity, quoted above, is noteworthy, as it is often said that the case for free trade rested on the expectation that other nations would follow England's example. It is related that the second Lord LIVERPOOL (*q.v.*), after reading the petition, expressed his hearty agreement with every word of it. Some time had to pass before free trade was seriously considered. The petition, however, was "the originating impulse to the movement, which, by progressive steps, had led to the final establishment of the principles therein enunciated."

[Tooke's *History of Prices*, vol. v. p. 396; and vol. vi., London, 1838-57, 8vo: app. 1, pp. 331-344, where the petition itself is printed in full, with Mr. Tooke's account of the circumstances in which it originated.—Smith's *Wealth of Nations*, edited by M'Culloch, 4th edition, note xv., Edinburgh, 1850, 8vo.—Nassau Senior's *Three Lectures on the transmission of the Precious Metals, and the mercantile theory of Wealth* (delivered at Oxford in 1827), London, 1830, 8vo.] H. E. E.

MERCHET was the payment due from a villein tenant on a manor to his lord for leave to give his daughter or his sister in marriage. With the exception of an uncertain tenure, it was probably the most constant mark of serfdom, yet cannot be considered as an absolute test, as it was neither universal among holders who were certainly villeins, nor entirely absent from SOCMEN on ancient demesne. Occasionally, it seems, the payment was only due if the marriage would remove the woman from the manor or the hundred to which she belonged.

[Bracton's *Note-Book*, ed. Maitland, 1887, cases 395, 753.—Ducange, *Glossarium*.—Vinogradoff, *Villainage in England*.] E. G. P.

MERCIER (*alias* LEMERCIER) DE LA RIVIÈRE, PAUL PIERRE (1720-1794), was a member of the parliament from 1747 to 1759, where his attractive but determined character, his high integrity and loyalty, made him respected. In 1757 he was appointed steward of the island of Martinique, and discharged his duties there with great disinterestedness and fertility of resource. He even devoted his personal credit, and when necessary his own money, to the public service. He reaped nothing but ingratitude from this at first. The Duc de Choiseuil, then minister for the navy and foreign affairs, took umbrage at his applying the principles of free trade to the colonies which he governed in complete opposition to the colonial system in force at that time. He was recalled; but he had anticipated this and returned to France by order of his doctor, July 1764.

On his retirement to private life he wrote and published, in 1767, *L'Ordre Naturel et Essentiel des Sociétés Politiques* (1 vol. 4to, or 2 vols. 12mo), a work which made such a sensation in his time that some of his contemporaries placed it, not only on a level with, but even above *L'Esprit des lois*. This book, apart from its physiocratic errors and inordinate overpraise of absolute power (the author suggests the despotism of China as an ideal model), contains some fine passages which were obscured by the tone of exaggeration in it. It explains the ideas of the PHYSIOCRATS. Their economic opinions, which are very simple, may be summed up thus: there is only one industry which gives a net product capable of increasing social wealth —this is agriculture. Other industries can only produce an equivalent to the amount employed in them. In one word, agriculture alone is really productive. Hence, taxation is in the end always borne by agriculture, and to avoid useless and costly repercussion of taxation it would be better to have a single tax—the IMPÔT UNIQUE. Adam SMITH, who was in a position to judge this book impartially, says (*W. of N.*, bk. iv. ch. ix.) that it contains "the most distinct and best connected account of this doctrine," that of the

ÉCONOMISTES (*q.v.*). The Empress Catherine II. invited Mercier de la Rivière to St. Petersburg. According to her account of the matter, by his pretentiousness and want of tact, he made himself ridiculous there. He returned, according to the Czarina, dismissed, but largely rewarded by her. This had little in common with the disinterestedness he had shown at Martinique. Mercier, according to his own statement, refused the position and pension he was offered, only taking what had been agreed on when he left France. This seems nearer the truth. Catherine sneered at him; "He believed," she wrote to Voltaire, "that we walked on all fours and he came charitably to set us on our hind legs."

Mercier de la Rivière wrote many works, but only those on political economy are quoted here. *L'intérêt général de l'état ou la liberté du commerce des blés*, 1770, 12mo.—*De l'instruction publique*, 1771, 4to.—*Procès pendant au tribunal du public; lettre sur les économistes* (undated, probably 1787). Du Pont (de Nemours) has cleverly summed up *L'ordre naturel* in *De l'origine et des progrès d'une science nouvelle*. This, as well as the work of which it is an abridged version, is printed in Guillaumin's collection (*Physiocrates*, 1846).

[For the less-known events of the life of this author see the notice read in 1858 at the Académie des Sciences morales et politiques, by M. Felix Joubleau. See also account in L. de Lavergne, *Les économistes français du XVIII^e siècle.*]

A. C. f.

MERCIER, LOUIS SÉBASTIEN (1740-1814), a Parisian barrister, journalist, and member of the convention during the revolutionary period, —was a most copious and voluminous writer; and it is impossible to give here a complete list of his writings.

His best-known work is the *Tableau de Paris* (12 vols., Amsterdam, 1783-1788), which, notwithstanding its desultory and declamatory form, is valuable evidence of the moral and physical aspect of Paris on the eve of the revolution; it is full of life and keen observations. In 1792 he published a pamphlet, *Réflexions d'un Patriote sur les Assignats, les craintes d'une banqueroute Nationale, etc.*, intended to demonstrate that the fears concerning an impending national bankruptcy were unfounded. One of the first in date of his works is *L'An 2440, rêve s'il en fût jamais* (1771, reprinted 1800); it is the dream of a disciple of Voltaire and Rousseau, but free from any tendency towards a communistic reform of society. E. Ca.

MEREDITH, Sir WILLIAM (1724-1790), Whig politician, succeeded to the baronetcy in 1752. In 1765 he was appointed a civil lord of the admiralty. Horace Walpole describes him as inflexibly serious but of no great head, a judgment which his *Historical Remarks on the Taxation of Free States*, London, 1778, 4to, belie. In this work, in the form of letters to a friend, Meredith points the moral of the folly of attempting to tax the American colonists, by the examples of Carthage, Rome, Sparta, and Athens.

[*Dictionary of National Biography*, vol. xxxvii. p. 271.] H. E. E.

MERELLO, MICHELE (17th century). An economist who wrote on the deposit banks established in Italy in the 16th century. He describes the establishment of the historic bank of St. George, Genoa (see BANKING), founded to consolidate and provide for the redemption of the debts of that republic by uniting the creditors in a single institution and allowing them the proceeds of certain taxes for a certain number of years. The unification of these creditors was called *compera*. Merello, who objected to taxes, praises this system because the cession made by the state was for a certain number of years only and did not entail a perpetual burden on the citizen.

Della guerra fatta dai francesi . . . con una breve dichiarazione dell' istituzione della compera di San Giorgio, Genoa, 1607.

[Gobbi, *L'economia politica negli scrittori italiani del secolo XVI.-XVII.*, Milan, 1889.—Ricca-Salerno, *Storia delle dottrine finanziarie in Italia*, Rome, 1880.] U. R.

MERENDA, ANTONIO (17th century), was professor of civil law at the university of Pavia, and author of a treatise on exchange. The important changes in economics had weakened the old doctrines, and admitted the lawfulness of profits made from productive employment of money. Merenda protested in the name of CANON LAW (*q.v.*) against the comparatively liberal opinions of many writers of his day; who, though they proclaimed the most absolute respect for the principle that loans should be gratuitous, in practice sacrificed the enforcement of this doctrine, leaving openings for evasion. Merenda opposes any reconciliation between ecclesiastical precepts and the requirements of common life. He does not deny that LUCRUM CESSANS (*q.v.*) supplies a lawful motive for demanding compensation, but he requires such absolute and complete proof, almost impossible ever to obtain, that the efficacy of this principle is effectually annulled. Merenda does not doubt the lawfulness of a true and real exchange, but he adds that it becomes unlawful as soon as the suspicion arises that payment is to be made in a different place from that fixed in the contract. Merenda, distinguishing loans from exchange, and contrasting gratuitous loans with onerous exchange, is opposed to those forms of exchange which conceal usury (see INTEREST AND USURY), and criticised those authors who, by defending the means adopted by traders, regarded them as lawful. He also opposed fairs where usurious exchanges were effected.

De cambio nundinali Tractatus, Pavia, 1645.

[Cossa, *An Introduction to the study of Political Economy*, trans., London, 1893.—Gobbi, *L'economia politica negli scrittori italiani dei secoli XVI.-XVII.*, Milan, 1889.—Graziani, *Le idee economiche degli scrittori emiliani e romagnoli* Modena, 1893.] U. R.

MERGER. The term merger signifies the ending of a legal right by its absorption into a higher right of the same kind. Thus when a lessee purchases the property let to him, his rights as a tenant merge in his more extensive rights as a proprietor. When a man entitled to a servitude or an easement over his neighbour's land (*e.g.* a right of way) buys that land, his servitude or easement is similarly merged. Again, a simple contract is merged in a subsequent contract under seal, if made between the same parties and dealing with the same subject-matter. For a contract under seal confers more extensive rights than a simple contract does. Thus, a simple contract must be sued upon within six years of making. A contract under seal can be sued upon at any time within twenty years of making. F. C. M.

MERIVALE, HERMAN (1806-1874), was trained at Oxford, where he took a first in classics, and was elected fellow of Balliol, 1832. Recognised by his contemporaries as "one of the two best educated men in his university generation" (Dr. Vaughan, Funeral Sermon at the Temple Church, Feb. 1874), he maintained this position during life, for, according to an obituary notice in the *Economist*, he was "one of the most acute and best read political economists of his time." In 1837 he was elected to the newly-instituted chair of political economy at Oxford. In his preliminary lecture the professor distinguished between political economy the science and political economy the art, defending the science from the attacks of those who have looked to it as to a sort of philosopher's stone which would turn everything it touched into gold. Its object, he maintained, was *not to create but to prove;* and he utterly repudiated the idea that political economy was based on a degrading estimate of human nature.

He then considered the principles on which colonisation should be conducted, as connected with emigration, employment of labour, the disposal of public lands, and the system of E. G. WAKEFIELD (*q.v.*). His eighth lecture exposes the fallacy of the colonial system then in vogue. He pointed out that "altho' under certain conditions . . . a country might gain by the possession of an artificially monopolised market for its manufactured commodities, yet in actual practice such gain is found to be wholly illusory."

The publication of these lectures led to his employment under government; he became under-secretary of state in two of the most important departments of government for the long period of twenty-six years—from 1847 until his death in 1874.

The late Lord Lytton wrote, in his copy of Merivale's *Historical Studies:* "The author is one of the most remarkable men I have ever met. The main characteristic of his intellect is massiveness—and it is the massiveness of gold . . . he belongs to the very highest order of mind in my time and country. I can compare him to no other of less calibre than Macaulay . . . Macaulay is the finer artist, and Merivale the more original thinker."

Five Lectures on the Principles of a Legislative Provision for the Poor in Ireland, 1838.—*Lectures on Colonisation and the Colonies*, 1st ed., 1841; 2nd ed., 1861. A. L.

MERTON, THE STATUTE (OR PROVISIONS) OF, 20 Hen. III. (1235-36), contains several chapters, but that of most economic importance is c. 4, which is what is commonly understood when the "Statute of Merton" is referred to. "Whereas," it runs, "many magnates of England, who have infeoffed their knights and free tenants of small tenements in their great manors, have complained that they cannot make their profit (*commodum*) of the residue of their manors, as well as of the wastes, woods, and pastures . . . it is provided that whenever such feoffees do bring an assize of novel disseisin for their common of pasture, and it is acknowledged before the justices that they have as much pasture as suffice to their tenements, and that they have free ingress and regress from their tenement into the pasture, then let them be content therewith." If it is proved that they have not sufficient pasture, they shall recover their seisin, and the disseisors shall be amerced and pay damages; if they have, then "let the others make their lawful profit of the residue."

[The statute is printed in *Statutes of the Realm* (1810), i. p. 1. The comments of Bracton, with a translation and some observations thereon, will be found in Digby, *Hist. of the Law of Real Property* (4th ed. 1892), pp. 190-208. It will be observed that the statute guaranteed only the rights of free tenants. Lord Chancellor Herschell has recently declared in the House of Lords that "the Statute of Merton has been practically obsolete for centuries, and it is only in comparatively recent times that it has been revived and again put in force," and that "the means of trying the right of the lord to enclose is a process which is not only obsolete, but which has ceased to exist." *Times* Report, 28th July 1893.]

W. J. A.

MESNIL MARIGNY, JULES DU (1810-1885). His *Économie Politique devenue science exacte* (Political Economy made an Exact Science, Paris, 4 ed. from 1859 to 1883) is principally written to confute J. B. SAY'S theory of exchanges, and to maintain that "the benefits which two nations reap from mutual exchanges of the same value may be very unequal." This leads to the assertion that "each nation must have its own political economy appropriated to its physical conditions and to its national character."

The avowed scope of his *Histoire de l'Économie Politique des Anciens Peuples de l'Inde, de l'Egypte, de la Judée et de la Grèce* (Paris, 3 vols., 1878, 3rd ed.) is to prove "in an irrefutable way, and by a

great number of instances, that the system of protecting national manufactures . . . was very often followed in antiquity." E. Ca.

MESSANCE, M. (18th century), an eminent statistician, revenue officer at S. Etienne-en-Forez in the reign of Louis XV. In 1759 he became under secretary to M. de la Michodière, intendant of Auvergne, and in this capacity he continued the statistical investigations instituted by his chief, with a view to disproving the theory of the author of *L'ami des hommes*, the Marquis de Mirabeau, as to the decline of population in France. In 1763 he presented the result in book form to the intendant, who insisted on its being printed in Messance's name [*Nouvelles Recherches*, p. 5].

In 1775 Messance sent a table of mortality, which he had prepared, to Voltaire, who in a humorous reply commented on its accuracy and utility. Messance's two works on population were issued at an interval of twenty-two years; in the second of these he refers to Necker's *Administration des Finances*, and Adam Smith's *Wealth of Nations*, both which publications had preceded it. His works are entitled:

Recherches sur la population des généralités d'Auvergne, de Lyon, de Rouen, et de quelques provinces et villes du royaume, avec réflections sur la valeur du blé, tant en France qu'en Angleterre, depuis 1674, jusqu'en 1764, Paris, Durand, 1766, 4to.—*Nouvelles recherches sur la population de la France avec des remarques importantes sur divers objets d'administration*, Lyon, 1788, 4to.

MESTA. "The *mesta*"—writes, towards the very end of the 18th century, M. de Bourgoing, a French diplomatist, who had a long experience of Spain,—"the *mesta* is a company of powerful sheep-owners, rich monasteries, Spanish grandees, wealthy individuals, who have succeeded in feeding their (migrating) flocks at the expense of the public during all the seasons of the year, and in obtaining unconsidered legal enactments to sanction a state of things which has been at first prompted by necessity" (*Tableau de l'Espagne*, vol. i. pp. 75-123, edit. 1807. The two first editions of 1789 and 1797 are anonymous). This necessity resulted from natural circumstances—the difference of climate between the cold mountains of northern and the warm plains of southern Spain, and from historical conditions—the existence, during the centuries of warfare between the Moors and the Christians, of an extensive debateable land, exposed to armed incursions and destitute of the security which is the primary requisite of agricultural cultivation. In 1200 king Alonso VIII. of Castile first granted the itinerant cattle herds the privilege of grazing on all waste and open lands, but subject to the obligation to compensate the owners for all damage to inclosed fields, vines, gardens, standing crops, etc. This privilege, gradually enlarged and confirmed under subsequent reigns, led to most abusive encroachments, especially under the growing influence of the *Honrado Concejo de la Mesta* or Honorable Association of the Cattle-owners. The exact date of its foundation is unknown, but it certainly goes back very far into the middle ages. About 1500, Ferdinand and Isabella, being in want of money, listened to the solicitations of the *Concejo de la Mesta* and gave it an official status by appointing a president and calling to that post a minister and member of the royal council. In 1511, the ordinances and laws concerning the *mesta* were by royal command collected by Palacios Rubios, a celebrated jurisconsult of the time, approved and promulgated. The privileges thus confirmed may be epitomised as follows:

1. The right of pasture on all open lands, which led to constant and successful interference of the *mesta* against all attempts of inclosing or even putting under tillage hitherto unbroken land. Their pretensions were formally recognised by a law of 1633, forbidding the plantation of new vines and the ploughing of previously uncleared land.

2. The obligation to keep open at all times *cañadas* or broad tracks for the free and unimpeded passage of the cattle, which were to be able to move "grazing." No inclosures were tolerated on either side of the *cañada*, and the flocks unmercifully invaded the neighbouring gardens and fields.

3. The exemption from several taxes and tolls, which indirectly led to new burdens imposed on the already overburdened tillers of the soil.

An official census of 1480 puts down at 2,694,032 the heads of cattle, which in 1477 had migrated through the passes of Castile; another account of 1563 gives the following numbers: 2,303,027 sheep and goats, 14,127 oxen, and 25,215 pigs. In 1724, Ustaritz (*q.v.*) computes the number of migrating sheep at 4,000,000 (which figure is confirmed by an official census of 1746), with a much higher estimate for settled and permanent flocks.

The devastations caused by the wandering flocks of the *mesta* have been the main cause of the ruin of Spanish agriculture. This frightful oppression lasted until the end of the 18th century, and only receded before the strenuous endeavours of the enlightened statesmen of the time, Florida-Blanca, Rodriguez de Campomanes, and most of all JOVELLANOS (*q.v.*).

[A substantial historical account of the *mesta*, and of the Spanish literature on the subject, is to be found in chs. xxxiv. and lxiv. of Colmeiro's *Historia de la Economía Política en España*. METALS, PRECIOUS. See GOLD; PRECIOUS METALS, Discoveries of; SILVER.

MÉTAYAGE; MÉTAYER, called in legal phraseology *colonat partiaire*—an expression taken from Roman law—refers to a cultivator who pays his rent in kind: it is a particular method of *fermage* or farming land. *Métayage* differs from *fermage* in that the rent, instead of being paid in *money* and *fixed* throughout the whole period of the lease, is paid *in kind*, and consequently *varies* with the yield itself; a portion of the yield, usually the half, being set aside for this purpose.

This arrangement is very usual in certain countries, as in Italy, Portugal, the countries bordering on the Danube, in Russia, and also in France. In France, out of 33 million hectares cultivated (nearly 82,000,000 acres), $4\frac{1}{2}$ millions (11,000,000 acres)—14 per cent—are managed on the *métayer system*, 27 per cent under the usual arrangements for farming; the remainder, 59 per cent, being cultivated by the proprietors themselves. In Italy, out of less than 11 million hectares cultivated (27 million acres), $5\frac{1}{2}$ millions, or 50 per cent, are managed on the *métayer* system.

Métayage appears to have been much more in use formerly than at present. Arthur Young, at the time of the revolution, estimated the land cultivated on this system in France to be $\frac{7}{8}$ or 87 per cent of the whole. From this continued decrease it might be concluded that *métayage* is an antiquated institution, condemned sooner or later to disappear.

It is true that *métayage* seems better adapted to poor districts, and that it may be in time superseded by *fermage*, that is by money rents, or by the proprietor cultivating his own land himself, in proportion as the district becomes richer and the cultivation better, that is, more intensive. The *fermier*, in fact, is always a capitalist, and even, more generally in England, a fairly large capitalist, while the *métayer* generally has no capital, and possesses nothing but his labour and some agricultural implements of little value. He tills the ground himself and avoids everything connected with an expensive mode of cultivation, what is called in France *la culture intensive*, for what good would there be in his spending, for instance, £100 more a year to increase the raw product by £200? He would only get the half of this product (£100), and in consequence would not gain a penny. On the other hand the owner himself hardly cares to invest a large capital in working the farm, for the dividing by half the addition to the raw product arising from the employment of this capital, would be too disadvantageous to him.[1]

However, if *métayage* appears inferior to *fermage* from an economic, it is superior to it from a moral point of view. And this superiority has been sufficient to maintain the institution in many countries, and even now rallies round it more supporters perhaps than formerly. This moral superiority springs from the following causes:

(1) While *fermage* establishes enmity between the owner and the *métayer*, *métayage* establishes a unity of interests between them. Both share alike in good and bad fortune; there is a real association between them, and it is one of the oldest and most admirable forms of PROFIT SHARING which those who see in co-operation the solution of all social difficulties should regard with favour.

(2) The *métayer* is never straitened by the mode of payment, because he pays in kind. He only gives the proprietor what the earth itself gives—nothing, if it yields nothing—much if it yields generously. He never has to pay the landlord anything out of his pocket.

On the other hand the *fermier* is always compelled to provide the money even when the land yields him nothing, is often straitened, and comes to regard the proprietor as an oppressor, a kind of tax-collector.

(3) The *métayer* is guaranteed against injurious exploitation to which the *fermiers* so often find themselves exposed through competition among themselves, which sometimes raises the rent to an exorbitant amount (rack rent).

Métayage, by its customary fixing the division of the product into halves, wards off completely the influence of competition on price, quenches all controversy as to the amount of the rent, and does not permit the proprietor to monopolise all the profit (FAIR RENTS, *q.v.*).

(4) *Métayage* gives better assurance of a long duration of lease than *fermage*. In *fermage*, as a matter of fact, the owner is always seeking for a new *fermier* who will pay him a higher

[1] This may be modified by a certain standard of farming being required by the *usages locaux*.

rent than the former tenant. But in the *métayer* system, what is the good of a change of *métayer*, since the rent is the same whoever be the tenant? The owner has no reason for dismissing his tenant, or at least none but personal reasons. There are *métayer* farms which remain constantly in the same family, passing from father to son, as in the Limousin is stated to have been the case for 300 years.

(5) Finally in *métayage* the owner necessarily takes much more interest in the cultivation of the land and the success of the harvest—since his share depends on it—than in *fermage*, as in this case he receives his rent in money whatever occurs. Hence intercourse is more intimate and even familiar between the owner and the *métayer*.

For all these reasons the *métayer* system may be considered as an element of social peace and capable of solving in certain cases the agrarian question.

Moreover, the contract according to the *métayer* system can be modified according to the circumstances, and thus lends itself better to the exigencies of an improved culture. For example there might be a system of *métayage* in which the *métayer* would provide more or less considerable capital. This is the case in the south of France, and assists the planting of some large vineyards there. The proprietor merely provides the ground; the *métayer*, the "vine-dresser" as he is termed, plants this at his own expense, employing large capital, but the vintage is divided with the owner only after the 5th or 7th year. A system of *métayage* might also exist in which the landowner would advance the capital, stipulating for the payment of a moderate interest, and this might assist a solution of the problem of agricultural progress. In a word the time-honoured system of *métayage* might be re-instituted in different ways and adapted to new requirements, while still keeping those essential characteristics which are its great recommendation, namely that it forms an "association of gains and losses" as defined in the old French law.

G. G.

MÉTAYER, in West Indies. The métayer system of cultivation has an interesting example in some of the West Indian colonies—notably Grenada, St. Vincent, and Tobago, where it is also termed "métairie" or "métayage." It was introduced for the purposes of sugar cultivation when these islands were under French rule, and has subsisted to this day. Up to 1887 or 1888 there had been very little friction between the owners and métayers, but about that time certain judgments of the then chief justice of Trinidad and Tobago caused a stir in the latter island, and in 1889 a committee investigated the whole question of the relations of the two parties to the contract. The contract had originally been, as a rule, a *parol* agreement; there had recently been a tendency to employ written agreements, and in 1888 the legislature of Tobago had proposed to regulate the contract by local ordinance.

The agreements between landowner and métayer vary considerably in their details, but their usual outline is as follows:

(*a*) The *landowner*—
- (1) provides land for sugar cultivation,
- (2) at crop time gives the use of mill and machinery, carts and mules, or one of these, and also provides certain skilled hands for manufacture.

(*b*) The *métayer* undertakes—
- (1) to cultivate the land to the best of his ability,
- (2) to keep the roads across or around his land in good repair,
- (3) to give his labour on other parts of the estate at a fixed rate for certain days in each month,
- (4) to resign to the landowner half the sugar made from his land, besides a considerable proportion of the molasses.

The proportions with which the produce is divided are not always the same; but a fairly even division is the basis of the arrangement.

The system has never been the economic success which one might have hoped; the sugar was usually roughly manufactured, and owners complained that their mills and boilers were often damaged. But it has been useful where, as in Tobago, there has been great dearth of floating capital to pay the wages of labour.

METHOD OF POLITICAL ECONOMY.

(*a*) Scope of Economics, p. 739; (*b*) Economics and General Sociology, p. 741; (*c*) Divisions of the Science, p. 741; (*d*) Formal Economics, p. 741; (*e*) Narrative Economics, p. 742; (*f*) Constructive Economics, p. 743; (*g*) Inductive Methods, p. 744; (*h*) Deductive Methods, p. 746; (*i*) Criticism and Combination of Methods, p. 747.

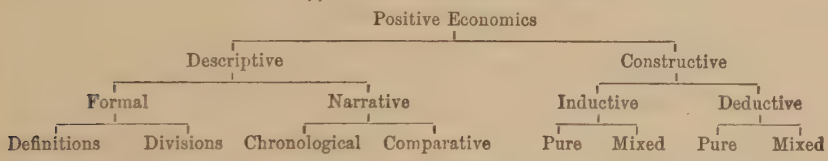
(*a*) *Scope of Economics.*—Before treating of the various methods applicable to economic investigation, a brief examination of the scope of political economy is necessary. It is almost universally agreed that economics deals with wealth, or, more precisely, with those human

activities the end of which is the appropriation of wealth. But admitting this common standpoint, there are yet two different directions in which economic study may proceed. The science may aim at merely ascertaining facts or at directly regulating conduct—its propositions may be couched either in the indicative or in the imperative mood. On the former view economics is called a positive or theoretical science, on the latter a regulative or practical science. But, whichever of these two views is taken, a further distinction must be made according as the propositions of the science have an abstract and general or a concrete and special application. The precepts of regulative economics, and the uniformities of positive economics, cannot be immediately applied to the guidance of conduct or the interpretation of phenomena. For every rule must be modified in consideration of the peculiar conditions of the society and epoch to which it has to be applied; and the recognition of the single pursuit of wealth must be qualified by consideration of other ends and motives. Thus the precepts laid down by the regulative science may be either *general*, *i.e.* applicable to all societies, or *special*, *i.e.* having reference to the particular conditions of a given society. And again they may be either *abstract*, *i.e.* restricted to the consideration of a single end, such as the maximising of production, or the equalising of distribution; or *concrete*, *i.e.* prescribing a due co-ordination and subordination of different human ends. Similarly, the facts described by positive economics may be either of *general* applicability to all societies, or may take account of the peculiarities of *special* social institutions and forms of civilisation. And again they may treat of men in an *abstract* form, so far as they pursue wealth alone; or in a more *concrete* form, as subject to various influences that conflict with the pursuit of wealth.

Although the distinction between precepts and facts—between a regulative and a positive science—has been maintained as essential, especially by British economists from SENIOR onwards, yet there are some grounds for merging the two aspects in a single treatment. In the first place, a precept may always be expressed as a conditional uniformity—"If such conduct is adopted, such a result will follow," *e.g.* if pauperism is encouraged, the average wages of the working man will be lowered. The reader may then be left to his own judgment to decide whether the result in question or its avoidance is desirable. Secondly, in many cases there is practical unanimity in regard to the desirability of certain ends. Other things being equal, greater wealth, or the more equal distribution of wealth, may be assumed as a desirable result. Agreement as to the end in view is more particularly obvious in technical problems, such as banking, currency, state finance, and taxation. In the third place, it may be urged that the aims of individuals as well as governments are determined by their ethical ideals; and that therefore it is impossible, or at least undesirable, to separate the actual from the moral aspect of human pursuits. For these reasons it may be maintained that the distinction between the positive and the regulative sides of economic study is less fundamental than that between its abstract and its concrete aspect. In the actual course of discussions on method, it has been often supposed that the positive treatment of the science will necessarily assume an abstract character, and that the regulative treatment must assume a concrete character. For those writers who have aimed at regulating conduct in the interests of a given society have naturally recognised the need of examining its complex conditions; and those who are only concerned with theorising on economic phenomena have naturally tended to treat in isolation the single pursuit of wealth. In the latest development of the controversy, it has been acknowledged by the more impartial writers on both sides that there is room for work in all fields. The ultimate aim of economic investigations is, no doubt, practical, *i.e.* to guide conduct in the actual conditions of affairs. For this purpose we must understand the operation of causes in the society in which we move. But, further, we require a general estimate of the comparative values of different ends of human pursuit. And, in order to understand the particular facts of any one individual society, we need the guiding principles of general theory. The propositions of economics expressed in their most accurate form will be doubly conditional, thus: "Given such or such a constitution of society, if such or such measures are taken, such or such a group of effects will follow." Of the effects produced some will be desirable, others undesirable. To determine whether the balance is towards the good or the evil, some reference to ethical considerations is necessary. Again the results to be anticipated from any course of action depend on the nature of the society for which the measures are proposed. Complexity of conditions and complexity of effects have thus to be taken into account. As a basis of practical economics we need, on the one hand, a general theory of the action of industrial forces; and, on the other hand, an ethical survey of the value of human ends. The former is a necessary preliminary for the explanation of the concrete facts of society, and the latter for the discovery of right rules of conduct appropriate to these concrete facts. It follows, then, that a *science* of economic causes and effects must precede the *art* of political economy; and that this art is related to the science in the same way as any branch of applied knowledge is related to the corresponding theoretical knowledge.

(*b*) *Economics and General Sociology.*—Although the name political economy is still preserved, the science, as now understood, is not strictly *political*: *i.e.* it is not confined to relations between the government and the governed, but deals primarily with the industrial activities of individual men. On the other hand, the science does not deal with individuals, *quâ* individuals. It is not, therefore, in any sense a branch of psychology. Even when it discusses the utility of objects of desire, and the sacrifice incurred in procuring them, it only measures utility and sacrifice, not subjectively, but as embodied in objective form. Hence the subject matter of economics gives it a place among the social, rather than the political or the psychological, sciences. Being admittedly a social science, the question has arisen as to its relations with other social sciences, and its position relatively to general sociology. Some writers, under the influence of COMTE, have maintained that economics cannot be profitably treated at all as an independent branch of study. They hold that there is such an intimate consensus amongst all the causes and effects of social life, that it is impossible to isolate any one group of phenomena—such as the industrial—and to treat this apart from the others. On this view economic facts cannot be explained without taking into account all concurrent causes, and rules for economic guidance cannot be formulated without taking into account all concurrent effects. All thinkers allow that no one group of social phenomena is completely isolated from another. But, in answer to the extreme Comtist view, it is urged that there are certain kinds of effects which are predominantly due to a single kind of cause, and that there are certain kinds of causes which produce a single predominantly important kind of effect. So far as this is true, the explanation of economic phenomena and the regulation of economic conduct may be treated independently of other sides of social life. Science has never been advanced except by specialisation. A distinction may, however, be made between two parts of economic doctrine. When the economist attempts to trace the general forms of transformation which economic phenomena present in the course of development, and to make broad comparisons between one society and another, it is true that economic phenomena cannot usefully be treated apart from the influences of religious, moral, intellectual, and political conditions. But when tracing the modes in which industrial forces operate under given social conditions, he need not enter into a scientific analysis of these conditions, and, assuming them to be relatively stable, he need not analyse the slow and gradual changes which they undergo. In brief, even though the theory of economic *evolution* may properly be subsumed and absorbed under the general science of social evolution, yet the doctrine of what may be called the statics and dynamics of industrial forces is rightly treated in entire independence of other branches of social science.

(*c*) *Divisions of Economic Science.*



Putting aside the ethical function of criticising economic ideals, and regarding rules of conduct as properly expressed in the form of conditional statements assigning the connection between measures and their consequences, we may confine attention to economics as a *positive* science that deals with relations of fact. So regarded it falls into two main divisions, which may be called respectively *descriptive* and *constructive*. The former branch describes the conceptions and facts with which the science deals; and the latter establishes laws or uniformities. Descriptive economics again divides into a *formal* and *narrative* branch; of which the former analyses and classifies the conceptions needed for understanding the science in its widest applications, and the latter investigates historically and comparatively the various forms of economic life exhibited by different communities and at different epochs. Constructive economics, again, adopts a method which is either predominantly inductive or predominantly deductive; and under each head we must recognise a mixed method in which induction is modified by deduction, or deduction modified by induction. The above table will serve to show the scheme of the chief departments of economic science.[1]

(*d*) *Formal-Descriptive Economics.*—It must be acknowledged at once that the various departments of economics cannot be treated altogether independently of one another. The descriptions of economic phenomena must be regarded as in the first place provisional, and

[1] See also arts. on ABSTRACT POL. ECON.; ANALYTICAL METHOD; A POSTERIORI REASONING; A PRIORI REASONING; DEDUCTIVE METHOD; EXPERIMENTAL METHODS IN ECONOMICS; GRAPHIC METHOD; HISTORICAL METHOD; HYPOTHESIS; INDUCTIVE METHOD; LEAST SQUARES, METHOD OF; LOGIC AND POL. ECON.; MATHEMATICAL METHOD IN POL. ECON.; MEANS, METHOD OF; OBSERVATION (as distinct from Experiment); STATISTICAL METHOD; SYNTHESIS AND SYNTHETIC METHOD.

the form that they ultimately assume is necessarily dependent on theory. However, a general survey of ideas and facts must precede any investigation into the uniformities and dependencies among economic phenomena. In the formal-descriptive branch a provisional understanding is supplied of such general conceptions as those of wealth, capital, labour, appropriation, exchange, barter, money, and of the various subdivisions into which these conceptions fall. This branch of investigation involves the logical process of *definition* and *division*. Some writers are impatient of discussions of this purely formal character. Questions of definition are regarded as trivial, on the ground that they lead to merely verbal controversies. Definitions are, however, necessary mainly to prevent the confusion so prevalent between controversies about words and controversies about matters of fact or theory. Economics, in particular, has to borrow words from common speech, and common speech is ambiguous; hence, in default of a clearly assigned connotation, the economist is liable to introduce into his own writings confusion, misunderstanding, or inconsistency. Many disputes, for example, about capital have arisen from the failure to observe that different persons understand the term in different senses: and this applies to professed economists as well as to the ordinary man. The problem of definition gives rise to several difficulties. (1) Most of the terms employed, though in current use they cover a fairly understood range of application, are yet without any precise connotation. Definition therefore requires at the outset an *inductive* process of analysis and comparison to discover the characteristics common to all the various applications of the term. Often, however, a term is used so loosely that any possible definition will lead to a modification of its generally recognised scope in the direction either of expansion or of restriction. Nevertheless, the ordinarily understood range of a term in common use ought to be attended to; and it not infrequently turns out that the inductive investigation of popular usage will disclose important points of agreement or difference between classes of phenomena that would probably be overlooked if a more *a priori* mode of definition were adopted. (2) But, secondly, the process of defining a term is further complicated by the fact that some proposition into which the term enters is assumed to be true. For example, in the definition of capital it will be assumed that capital is a form of wealth which co-operates with other independent factors in the production of wealth. The definition of capital from this point of view provides an answer to the question "What other factor besides the raw materials supplied by nature and the efforts of human beings contributes to the production of wealth, and how far can this factor be conceived as independent of the others?" Or the definition of capital may implicitly answer the question "What is the nature of the service to the community and of the sacrifice to the individual which secures the payment of interest?" (3) Again, definitions involve a classification of economic phenomena, and so necessitate consideration whether the resulting classes are mutually exclusive and collectively exhaustive. Now the question of exclusiveness and exhaustiveness cannot be answered on merely logical grounds, but requires an investigation into matters of fact. Indeed the results of any such investigation may vary with variations in the stage of society considered. Hence even definitions partake of the character of relativity ascribed to all economic formulæ. (4) But more important than any other consideration is the question of framing a classification that will subserve the purposes of scientific investigation. Our definitions should lead to the formation of classes of which *universal* propositions of the greatest number and importance can be asserted, and between which the most impressive differences subsist. This latter aim is difficult to achieve because of the continuity of economic phenomena, *i.e.* the fact that different classes imperceptibly merge into one another leading often to limiting cases. The recognition of this principle of continuity is perhaps the most important characteristic of modern economic theory. (5) Definitions have finally to be completed by the construction of a nomenclature and terminology, in which a compromise has to be made between the claims of technical precision and convenience on the one hand, and of current phraseology and intelligibility on the other.

(*e*) *Narrative Economics.*— In narrative or historical economics are included not only accounts of past events in chronological order, but also comparisons between different societies, whether contemporaneous or not. Here we deal with particular facts ascertained by specific experience. In contrast with the *formal* branch of descriptive economics, the historical deals with actual phenomena having a definite position in time and space, and is thus concrete and circumstantial. But even the narrator must *select* his facts, and use his judgment as to what is of importance in reference to the particular species of phenomena which circumscribes his narrative. Again, no mere record of isolated events can be of service to science. The grouping of facts—whether as simultaneous or as successive—must be guided by assumptions of causal connection. In the first place, then, economic history cannot be comprehensible or instructive without a previous survey of the special conceptions systematised by formal economics. But this is not all. As formal economics requires reference to facts in order to procure appropriateness to its conceptions, so history requires reference to ideas in order to secure

coherence and systematisation in its presentation of facts. History is unavoidably coloured by the writer's theories of causal relations. Narrative economics, which occupies a middle position between formal and constructive economics, looking backwards, leads to modifications of the conceptions formulated by formal economics, and, looking forwards, becomes itself subject to modifications from constructive economics. One very important division of narrative economics is *Economic Statistics*. Although the range and implication of the term statistics appear to be very variously understood, yet we may at any rate regard statistics in the first instance as merely a descriptive-narrative department, dealing specially with numerical or quantitative results. The arrangement of such results in a coherent and instructive form requires not only logical and mathematical knowledge of a technical kind, but also special economic acquaintance with the action of industrial forces. The mere descriptive function of statistics is of course subordinate to its function of suggesting or verifying uniformities of cause and effect.

The importance to the economist of a wide knowledge of the various forms of economic institutions and habits that have actually appeared at different times and places, cannot be exaggerated. Some would hold that this historical knowledge is no part of economic science proper; others, that it practically exhausts the whole of the science. Since, however, it is one of the functions of history to criticise theory, and one of the functions of theory to criticise history, it would seem that acquaintance with particular facts and understanding of general laws are so intimately bound up, that there is as much need to protest against the exclusion of history from theory as against the exclusion of theory from history. The historian of industry requires training in economic reasoning, and the economic reasoner requires constant appeal to concrete facts. On these grounds narrative economics should be included as an introductory though necessary part of the whole of economic science.

(*f*) *Constructive Economics.*—The central aim of the science of political economy is the discovery and establishment of general truths relating to industrial life. The uniformities investigated may be divided on several different principles. Perhaps the most important distinction is that previously alluded to between *laws of industrial development* and *laws of the statics and dynamics of industrial forces*. The former department is a branch of the science of social evolution:—the science which traces regularity in the tendencies according to which one stage of society is in the course of time supplanted by another. This study necessarily regards man and society as in some sense organised wholes; *i.e.* it recognises all sides of human and social nature as co-operating towards some end consciously or unconsciously pursued. Not only are comparisons instituted between different stages of the same developing community, but also between any different communities that offer examples of different stages of development. On the other hand, the interactions between industrial forces present problems of an entirely different kind. Here the general condition of the society to which the investigation relates is accepted as a *datum*, not accounted for as a result of development. Hence in this treatment, no elaborate analysis of the various sides of social life is necessary. Whether it be the play of competition or the *vis inertiæ* of habit and custom, whether it be legalised serfdom or *laisser faire* that is assumed as the dominant characteristic of the society, either hypothesis is taken merely as a starting point for further investigations. Associated with this distinction of scientific aim is the distinction of scientific method. There is a natural alliance between laws of development and an inductive method based exclusively on experience; and a similar alliance between laws of interaction and a deductive method based mainly on calculation. Nevertheless there have been not a few writers who have treated evolution by highly *a priori* methods, while there have been many writers working with a fixed background of social conditions who have used the method of specific experience. In short, we have no right to identify the theorems of evolution with the inductive method, nor the theorems of dynamics with the deductive method. There is another distinction, viz. that between *abstract* and *concrete* economics which is liable to be identified with the distinction between the deductive and the inductive methods. By an abstract treatment of economic problems, is meant one in which the forces in operation are fictitiously simplified for purposes of investigation or exposition. The deductive method necessarily *begins* with an abstract treatment; but, in its complete form, qualifying conditions are gradually introduced which render the treatment approximately truthful to the real complexity of human life. The inductive method, on the other hand, begins with the complexities of actual economic conditions; but as it mounts up to higher and higher laws its statements become more and more general and, therefore, in a sense abstract. Pure induction starts with concrete detailed instances as its data, or premisses, and works up from these to uniformities of increasing simplicity. Pure deduction starts with abstract elementary principles as its data or premisses, and works down from these to uniformities of increasing complexity. The former passes from statements of greater to those of less circumstantiality; the latter from statements of less to those of greater circumstantiality. Symbolically from such premisses as "*ab* is *pq*, *ac* is

pr, *bc* is *qr*"; induction infers that "*a* is *p*, *b* is *q*, *c* is *r*"; while deduction infers the former from the latter. But no known writer has ever confined himself to the method either of pure induction or of pure deduction. There are two ways in which the methods of induction and deduction mutually co-operate in science; firstly, either method may be used to confirm or refute the *conclusions* of the other; and secondly, either method may be used to control or determine the *premisses* of the other. As to the former point, the term *verification* is usually given to an *a posteriori* confirmation of a deductively inferred result; and the term *explanation* to an *a priori* confirmation of an inductively inferred result. Whether the treatment of a question is to be called inductive or deductive depends on the preponderance of intellectual labour involved. If this be chiefly devoted to the collection, description, and comparison of facts, the method would be characterised as inductive; if to the consideration of alternative possibilities, the calculation of forces in combination, and the tracing out of chains of effects on general principles, then the method would be characterised as deductive. In induction the writer relies mainly on the number and variety of the instances cited, and on the degree of circumstantiality with which each case can be described in both its quantitative and its qualitative aspects. But here the results cannot be safely applied except within a narrow range of experience. Hence the need of *a priori* confirmation, which will often determine the limits of applicability of the empirically obtained uniformity. In deduction, the writer relies on exactness in the statement of postulates, exhaustiveness in the survey of alternative possibilities, and thoroughness in the tracing out of a chain of effects dependent on any postulated change. But here the result must be regarded as expressing only a *tendency* which may or may not be realised in the actual complexities of life. Hence the need for an *a posteriori* confirmation, which will transform the statement of a mere tendency into one of realised fact. It should be specially noted that the confirmation by one method of a result reached by the other does not usually amount to an independent establishment of it. For the examples brought forward to confirm an *a priori* deduction may often be few and incompletely analysed; and the principles adduced in confirmation of an *a posteriori* induction may often be indeterminate and incompletely synthesised. A method is to be characterised as inductive or as deductive, according as the form in which *facts are analysed*, or that in which *principles are synthesised*, is the more logically cogent. We next examine how either method is used in regulating the *premisses* of the other method. The premisses of the deductive argument are conclusions derived from observation, which may be either of a very general kind, or of a more special kind applicable to a given state of society and dependent on scientific analysis of economic phenomena. Such premisses refer either to the action of single isolated forces, and thus supply major premisses or principles; or else to the particular conditions of the society under consideration, and thus afford minor premisses. Somewhat in the same way as induction supplies premisses for deduction, so the results of deduction determine the form assumed by the premisses of the inductive process. For in order to bring facts together to any purpose, it is necessary to know in general outline the agency of economic forces. The relation of cause and effect does not involve merely or necessarily contiguity in space and time. Hence the collector of facts needs the guidance of theory in order that his analytical descriptions may include all that is relevant and exclude all that is irrelevant.

(*g*) *Inductive Methods.*—The inductive method rests on a collection, analysis, and comparison of concrete instances, with the view of discovering, within the range of observation, uniformities that may be extended beyond that range. The instances are collected as they agree or differ in respect to some one circumstance, which it is sought to connect causally with some other circumstance. There are thus two fundamental methods of induction, that of *agreement* and that of *difference*. Each of these methods assumes several subordinate forms, and these varieties of form may be combined so as to increase the cogency of any inference. In the method of difference, we infer with respect to some circumstance in which the compared instances *differ* from one another; in the method of agreement, with respect to some circumstance in which the compared instances *agree* with one another. In the method of difference it is essential that the instances compared shall *agree* with one another as closely as possible in all circumstances not known to be irrelevant; in the method of agreement, that they shall *differ* from one another as far as possible in all such circumstances. Expressing the methods symbolically, in comparing instances AB and AC, when the conclusion relates to A, we are employing the method of agreement, when to B or C, the method of difference. For example, if we compare two countries resembling one another only in the fact that both have adopted a policy of free trade [A], and infer that their prosperity is due to this policy, we are employing the method of agreement. If we compare two countries differing from one another only in the fact that one has adopted free trade [B] and the other protection [C], and infer that the superior or inferior prosperity of one is due to this difference of policy, we are employing the method of difference. It should be pointed out that the functions of the

two methods are not precisely identical. The method of difference proves—not that the differential circumstance would in *all* cases be efficient—but only when conjoined with the accompanying circumstances of the case. By this method alone it is impossible to discover how many of these accompanying circumstances were part-agents in producing the effect observed. It is therefore impossible to determine the range over which the causal relation may be extended. In order to *generalise* with respect to any one circumstance, we require the method of *agreement*, by which all other circumstances are shown to be irrelevant. Thus, if we can find a sufficiently varied group of strikingly prosperous communities, agreeing with one another only in the adoption of FREE TRADE, we have evidence that free trade *under any circumstances* will lead to prosperity. Causal connection in any single instance can only be proved by the method of difference, while a generalisation or uniformity can only be established by the method of agreement. The latter method determines, within certain limits of probability, the range over which we may extend any causal connection otherwise established. The explanation of this contrast is as follows: The law of causation tells us that *total agreement* between the causes operative in two instances would ensure *total agreement* between their effects; and conversely. Hence, if there is a *partial difference* between the effects in two instances, there must always be at least a *partial difference* between the causes; and conversely. This principle is that upon which the method of difference rests. On the other hand, it is not in general true that a *partial agreement* between the effects manifested in two instances would ensure even a *partial agreement* between their causes; and conversely. The method of agreement is, therefore, not absolutely reliable, since it depends on a principle which is not universally and without qualification valid. The two methods of agreement and of difference are necessary to supplement one another; the latter being required to establish *causal* connection in a single instance and the former to establish *uniformity* of connection.

Since, however, we can seldom fulfil the requirements of either of the two methods, we must practically have recourse to the *joint method*. Here we collect two sets of instances—one circumstance that is present in every instance of the first set being absent, or otherwise modified, in every instance of the second set. The more closely any pair of instances taken from the two sets agree, the more nearly we approach the requirements of the method of difference; and the more the instances in each set vary among themselves, the more nearly we approach the requirements of the method of agreement.

So far, in analysing the above methods, reference has been made to circumstances as simply *present or absent*. But the most important applications of induction are—not to mere *qualitative* agreement or difference—but to *quantitative* agreement or difference. Precisely the same methods apply to quantitative variations as to qualitative presence or absence, except that instead of taking only *two* instances, or two *sets* of instances of presence and absence respectively, we take any number of instances, or any number of *sets* of instances, in each of which a different magnitude of the variable quantity is presented. This method is called the *method of concomitant variations*. If the instances taken agree in all respects except in the magnitude of the variable quantity, the method is a mere extension of the *method of difference*. But the case in which instances are arranged in *groups*, according to the magnitude of the quantity present, is an extension of the *joint method*. This, in fact, constitutes the *complete method of pure induction*. Instances are arranged in separate heads, according to the various modifications of which some phenomenon is susceptible. Instances under each head, agreeing in some particular modification, are chosen which shall *differ* as far as possible as regards other accompanying circumstances; while instances under different heads are chosen which shall *agree* as closely as possible in regard to all other accompanying circumstances. When, from such a group of instances it is found that one variable quantity remains constant whenever another is constant, and differs when the other differs, we have the highest, purely empirical, ground for inferring causal connection between the two quantities.

The complete method of pure induction not only assigns causal connection between two phenomena on the ground of the concomitance of their quantitative variations, but it further determines the *law* according to which the variations in the one phenomenon follow variations in the other. Thus, if the method could be applied to economic data, not only would it establish a causal relation, say, between the price of corn and the marriage-rate, but it would determine the one quantity as a *function* of the other. Similarly, in connecting the price of corn with the amount supplied. To elicit, from a number of arithmetical data, the most probable law of variation involves special mathematical and logical canons, for which the articles on STATISTICS; LEAST SQUARES, METHOD OF; AVERAGE, etc., should be consulted.

Theoretically, the chief difficulty of applying pure inductive methods to economic phenomena is owing to the *composition of causes*. An effect in the economic world is invariably due—not to one kind of cause—but to the co-operation and interaction of a number of different causes, which all contribute to determine the actual phase or degree manifested in the effect. Hence

by mere observation, it is impossible to detect the underlying agreement in different instances of the effect of any one cause,—the effect due to this one cause being modified through intermixture with the effects due to others. Instances compared according to the method of difference are not, however, in the same way vitiated by the action of the composition of causes. If the force operative in two instances, otherwise similar, differs in kind or intensity in the two instances, then any observable difference in the effect may be ascribed to this difference in the cause, although other forces may be operating in conjunction with that observed. A special variety of the method of difference applied to cases of composition of causes, is called the *method of residues*. This method is partly of an *a priori* and deductive character. It applies to cases in which the effects of all but one of the causes in operation are known, both as regards number and magnitude. If then, the actually produced effect is compared with that which would have been produced by the composition of the causes whose effects are known, the difference will determine the amount due to the cause in question. A simple example in economics of the method of residues is supplied by examining the rates of exchange of foreign bills. If the rate of discount current at the time is known on *a priori* or independent grounds, then a comparison between the exchange and the rate of discount will determine how much of the effect is to be put down to the temporary inequality of mutual indebtedness between the countries.

(*h*) *Deductive Methods.*—The character of the results reached by the deductive method will depend mainly upon the nature of the data or postulates which are assumed as premisses. It would not be possible to enumerate all the assumptions that have been made by different economists and for different purposes, but there are some half dozen which may be taken as typical and almost universally applied. Of these six data, two belong to each of the divisions, physical, psychological, and social. (1) The two physical or natural laws presupposed are the law of DIMINISHING RETURNS, which arises from the necessity of having recourse to inferior agents of production, or to their use under less advantageous circumstances; and the law of INCREASING RETURNS which results from the increased possibilities of industrial organisation under extension of supply. Both these laws represent *tendencies* ascertained by ordinary observation, which work in opposite directions. Hence more exact knowledge as to the magnitude of the forces in particular circumstances has to be supplied by further detailed observation. (2) The two psychological data are general expressions of the nature of DEMAND and of SUPPLY, so far as these depend on the characters of individuals. The law of demand is to the effect that the utility afforded by any increment of any kind of desired object diminishes with increase of the amount possessed: the law of supply is to the effect that every one tries to procure material well-being with the least possible sacrifice. These assumptions are common to almost all economic reasonings of a deductive type, though they are not always explicitly formulated. Here, as in the case of the physical presuppositions, further detailed observation is required to determine the precise degree in which these psychological forces act under any circumstances. In particular, the law of supply requires to be made more definite by an estimate of the influences of habit, inertia, ignorance, or custom, which materially affect its application. (3) The two sociological data relate to the conditions of freedom and restraint under which the economic activities of a community take place. Speaking generally, it is assumed on the one hand that individual action is controlled by certain legalised institutions with regard to property, and, on the other hand, that individuals are free to act according to their own will within certain limits. A similar remark applies here, as before, namely that the precise degree of freedom or of restraint, operative under any circumstances, has to be determined by specific observation. In analysing the postulates of deductive economics, reference is generally made to *competition*; but under this term a good many ambiguities are concealed. Competition is sometimes used to exclude any form of combination; but abstract economics does not exclude any form of combination which individuals may find it to their interest to enter into. Again, competition sometimes implies merely legislative freedom for every one to act for his own interest; but at other times it implies that equal remunerations are secured for equal services. Now this latter depends on the *effectiveness*, not on the mere *freedom*, of competition. Again, freedom of competition may imply the absence — not merely of governmental interference—but also of all sentiments, habits, or dispositions which might check the active pursuit on the part of every one of his own interests. There is a distinction between the restraints imposed by the social and legal environments and those due to psychological and individual character. Now, with respect to all these and similar presuppositions of deductive economics, considerable difference of opinion has arisen as to their validity or import. Some writers hold that they are of universal application, though, of course, requiring further determination by specific observations of particular communities (cp. Jevons, "The Future of Political Economy," *Fortnightly Review*, vol. xxvi. p. 625). Others hold that they express tendencies only which are liable to be counteracted by various forces of a secondary

kind (cp. Mill, Cairnes, etc.). Others, again, hold that the postulates of economics relate to societies within a narrowly limited range, viz. those which have reached the most highly developed and complicated form of industrial organisation (cp. Bagehot, *Economic Studies*, pp. 19, 20). Lastly, some have held that the premisses of deductive economics are absolute fictions, applicable tc no society of individuals that has existed or ever could exist (cp. F. Harrison, Cliffe Leslie). The truth is that, without further modification, few of the conclusions of deductive economics can be applied to the explanation or regulation of concrete circumstances; but that the method is necessary for controlling and guiding inductive observation. Moreover, the different postulates of deductive economics have different values in relation to different classes of phenomena. In some cases many more qualifications are needed than in others. These qualifications suggested by inductive observation can often be introduced into the deductive process itself. But, in any case, the limits of validity of deductively reached results must be examined by comparisons with experience; and in this consists the importance of deduction, checked, tested, and confirmed by induction.

(*i*) *Criticism and Combination of Methods.* In political economy *induction* alone is inadequate for the following reasons: (1) There is hardly any scope for experiment, whereby the effect of a single cause coming suddenly into operation in the midst of an unchanging environment could be observed. (2) The cause of any effect consists always of a conjunction of a large and intricate number of conditions which cannot be measured or empirically observed in separation. (3) The effects produced are often at first inappreciable; and cannot in any case be looked for until long after the first introduction of the cause. (4) Hence the effects are continually liable to be modified and interfered with by other co-operating or conflicting agencies, which come into operation after the special cause under investigation. On the other hand, *deduction* alone is inadequate for the following reasons: (1) The data or first principles of the science cannot be ascertained with quantitative exactness. (2) The character of the objects to which the science applies is liable to fundamental changes, so that there is no permanent basis upon which calculation can rely. (3) Even in a stationary society, the kind and degree of qualifying circumstances that modify the results cannot be known *a priori*. (4) No principle is known, like the parallelogram of forces in physics, according to which the effects of various forces in combination can be calculated.

In face of these obstacles to cogent inference by either the inductive or the deductive method, the fact that so much has been written in political economy which professes to employ one or other of these methods requires explanation. The answer is to be found in the consideration that much of what has been written comes rather under the *descriptive* than under the *constructive* head. Much of what is called deductive economics concerns itself with the preliminary process of clearing up misconceptions and presenting alternative possibilities in an exhaustively systematic form. So far as inferences have been worked out, they have merely made explicit what is involved in the postulates assumed at the outset, by carrying them to their inevitable consequences. This work of clearing up ideas, in so complicated a subject as that of the interaction of industrial forces, is so difficult, that no amount of care and trouble is thrown away in attempting to execute it efficiently. On the other hand, much of so-called *inductive* economics is concerned with the process of enlarging one's views of the varied forms in which economic life has been manifested from time to time, and of presenting problems from experience for theory to solve. So far as inference has been here introduced, it has consisted mainly in propounding a mere *suggestion* that, where agreements or differences have been observed, there is probably some causal connection which theory is required to explain. Such work is also extremely useful. What can alone be called *constructive* economics —involving genuine inference from the known or postulated to the unknown—has actually involved the co-operation of deduction and induction. Here, again, there is room for workers of opposite tastes and abilities, for we may still distinguish a method that is predominantly inductive but aided by deduction from one that is predominantly deductive but aided by induction. In the former, the facts of history are collected and prepared in the light of general theory, and an explanation of their connections is sought for on universal *a priori* principles. In the latter, the principles assumed are chosen on the ground of general conformity with experience, and a verification of the conclusions inferred is sought for in specific experience. So far as inductive generalisation fails to receive confirmation from indubitable general principles, it is led inductively to examine its facts more comprehensively. And so far as deductive calculation fails to receive confirmation from indubitable particular experiences, it is led deductively to apply its principles more concretely. Thus each method may learn from the results of the other without losing its own distinguishing characteristics.

[The English works in which the subject has been exhaustively treated are J. N. Keynes, *Scope and Method of Political Economy*, and J. E. Cairnes, *Character and Logical Method of Political Economy*. But almost all systematic writers on political economy have dealt more or less incidentally with the question of method. Without pro-

fessing to supply an exhaustive bibliography, the following important works may be mentioned:—

METHUEN TREATY. Portugal had been closely allied with England since the marriage of Charles II. with Catharine of Braganza (1661) and the recognition of Portuguese independence (1668) to which English arms and diplomacy had essentially contributed. But when the great question of the Spanish succession was raised in 1700, Pedro I. of Portugal was induced by France to acknowledge the Bourbon claimant, Philip V. It was a notable success for the Grand Alliance when, in 1703, Portugal deserted the Bourbon cause and joined in the war as a partisan of the Archduke Charles. In the negotiations which led to this change of sides a prominent part was taken by John Methuen, the English envoy at Lisbon. Methuen now seized the opportunity to secure commercial advantages for England by reopening the Portuguese market to English wool, which had been excluded from that country since 1680 in the hope of encouraging native agriculture and manufactures. On 27th December 1703, he succeeded in concluding the brief but famous treaty which has immortalised his name. It consists of two simple and straightforward articles: British woollen manufactures are to be admitted into Portugal on the same terms as before the prohibition, provided that Portuguese wines shall pay in Great Britain a duty one-third less than that charged upon wines from France. For more than seventy years this treaty was consistently observed, with the result that the cultivation of the vine was vastly extended in Portugal, and that in England port superseded burgundy as the ordinary wine drunk by the gentry. The treaty was regarded as specially advantageous to England, because a large portion of our exports were paid for in the gold which Portugal derived from Brazil. Hence the mercantilists reckoned that the balance of our trade with Portugal was more favourable than that of trade with any other country. This contention led Adam Smith to make a special attack upon the Methuen Treaty, which he condemned on three grounds: (1) British capital could have found more advantageous employments than the Portuguese trade into which it was artificially attracted; (2) we gave differential advantages to Portuguese wines, while Portugal promised none to English woollens; (3) England was forced to undertake the burdensome task of defending a very weak ally against Spain and France. It is undoubtedly true that the disadvantage at which French wines were placed in the British market contributed to strengthen and prolong the hostile feelings between France and England during the 18th century.

The first blow to the Methuen Treaty was dealt by the great Portuguese minister, Pombal. The market for British goods was restricted by sumptuary laws and by the systematic protection of native industry. In 1767 it was reckoned that our exports to Portugal had fallen from £1,500,000 to £735,000, and that the balance of the precious metals had sunk to £105,000. The dissatisfaction thus created facilitated Pitt's negotiations with France, and art. 6 of the famous commercial treaty of 1786 stipulated that "the wines of France, imported directly from that country, shall pay no higher duties in Great Britain than those now paid by the wines of Portugal." This was a virtual abrogation of the Methuen Treaty, but the subsequent outbreak of the long wars with the French republic and empire prevented the new agreement from being fully carried out. During the war, Portuguese wines paid 9s. 1d. a gallon and French wines 13s. 9d., and thus port retained its ascendency over burgundy and claret during the early part of the 19th century. In 1825 the duties were reduced.

but the same proportion was retained, and it was not till 1832 that Lord Althorpe, as chancellor of the exchequer, carried the equalisation of duties upon foreign wines at 5s. 6d. per gallon. In 1836 Portugal formally released England from the obligations of the Methuen Treaty.[1]

R. L.

METRIC SYSTEM—ENGLAND. The action of England in respect to the metric system of weights and measures has been characterised by precisely the same slowness and vacillation as has been described under the heading of DECIMAL SYSTEM in relation to coinage. Had it not been taken up, with more or less of zeal and perseverance, by various private individuals in the last hundred years, no English government or its executive would have so much as given it a thought. Space compels us to do no more than briefly refer to what was done during the second half of the nineteenth century. Entirely through private agitation, and mainly through that of the Metric Association, founded in London by some few leading men of science and business, a parliamentary committee was named in 1862 for the consideration of suggested reforms in our system of weights and measures. They recommended, with unanimity, a cautious but steady introduction of the metric system, and its legalisation, but not compulsorily until sanctioned by the general conviction of the public, and that a department of the board of trade should undertake the care and verification of the standards under the new system, and spread the knowledge of it in government departments and among the people, and use it alongside the present system in levying customs duties and in government contracts. It was also to be made one of the subjects for examination in competitions for entering the civil service. The *gramme* was to be used as a weight for foreign letters and books at the post-office. The metric system was to be taught in all schools receiving grants of public money. The recommendation of the International Statistical Congress, as to its use in our public statistics, was adopted; this was that its use should be allowed in private parliamentary bills, and metric and imperial measures exclusively used until the former came to be generally adopted. A bill was introduced into parliament to make the chief of these recommendations compulsory at a date to be fixed, say at end of three or more years. In committee the government objected to the compulsory provision, and substituted a permissive bill which was agreed to, and became the "Metric Act" of 1864. In 1868 a bill, afterwards abandoned, was brought in to introduce the metric system by compulsion, after a period to be inserted by government. In 1871 a bill with the same object was introduced, but Mr. J. B. Smith, then member for Stockport, who had long laboured with the Metric Association in discussing and arranging the terms of this bill, was defeated on a second reading by a majority of five. In the last quarter of the century, mainly arising from the decease of some of the most active and influential members of the Metric Association, and partly from the few survivors being tired of the apathy of the general public on this question, there arose a certain positive retrogression in the interest taken in it. At the close of the century a new body, under the revived name of the Decimal Association, again took it up, and a parliamentary committee, after resuming the task of taking evidence, reported almost unanimously in favour of legalising the metric weights and measures immediately, and of making their use obligatory at the end of two years, with provision for teaching the system in the meanwhile in every public school as a necessary and integral part of arithmetic. It would be a welcome sign of progress, if, in the public advantages expected to accrue from the recently elected strong government and executive, these recommendations were allowed to result in a complete reform. This ought, however, in our opinion, to be extended also to coinage, as if so important a step in the commercial and daily life, and in the education of the people, be once taken, it should not be in a piecemeal, but in a complete manner. The precedents of other European countries should be kept in view. They have not feared the change, but, greatly to their advantage, have successfully carried it through.

F. H.

METRIC SYSTEM (FRANCE, etc.), the system of weights and measures established in France by the law of 18 germinal, year III. (17th March 1795), and since adopted by a great number of other countries. The idea of a scientific basis for a standard from which all weights and measures could be derived had been put forward a century earlier by the astronomer Picard. The unit he proposed for his standard was the length of a pendulum, beating one second at the sea-level at forty-five degrees of latitude. No uniform system of weights and measures then existed in France, and although the *toise*, and the *livre*, were common expressions, the length of the one, and the weight of the other varied in the different provinces, and even between towns of the same province. A general reform of the

[1] Contemporary opinion differed as to the effect of the impost.

"Firm and erect the Caledonian stood,
Good was his mutton and his claret good.
'Let him drink port,' the English statesman cried.
He drank the poison and his spirit died."

Contra:—

"Drink the port; the claret's dear, Erskine, Erskine.
Ye'll get fou on't, never fear, my jo Erskine."

various systems was one of the desiderata contained in several of the "cahiers" submitted to the *États Généraux* which preceded the revolution of 1789, and the subject was taken up by the constituent assembly on a proposal by Talleyrand. By a royal decree of the 8th of May 1790, the king of England was to be invited to appoint a commission of savants to meet one of French academicians, and determine the length of the pendulum, as proposed by Picard. Political events prevented the execution of this project, but the French academy of sciences named a committee formed of Borda, Lagrange, Laplace, Monge, and Condorcet, to carry out the work. That body, however, set aside Picard's plan of the length of a pendulum as the basis of the new system, as well as a proposal to take a fraction of the length of the equator, and adopted as the initial measure, to be called the mètre, the ten millionth part of a quarter of the terrestrial meridian, with decimal multiples and divisions. There, however, remained to determine the length of the quadrants. Many savants had, during the century, taken measurements of parts of the meridian, but the results differed considerably. Picard fixed the length of the degree at 57,060 toises of six feet. Some astronomers put the degree as high as 57,422 toises, others as low as 56,750. Fresh surveys were ordered, and Delambre and Méchain were charged in 1792 to measure the arc of the meridian between Dunkirk and Mont Jouy near Barcelona. Those limits were selected as being at about equal distances, the one from the north pole, the other from the equator, each extremity being at the sea level. The result of their labours, which spread over a period of seven years, was to fix the distance from the poles to the equator at 5,130,740 toises, a ten millionth part of which was taken as the standard mètre. The length of the degree according to their calculation was 57,008 toises, differing but slightly from the 57,060 toises obtained by Picard more than a century earlier. A committee of weights and measures was then appointed to complete the work, by composing a system of weights and measures based on the metre, with decimal multiples and divisions. To indicate the multiples the Greek prefixes, *deca* ten, *hecto* a hundred, *kilo* a thousand, and *myria* ten thousand, were adopted; and for the divisions, the Latin, *deci* a tenth, *centi* a hundredth, *milli* a thousandth. A *décamètre* is consequently a lineal measure of ten *mètres*, a *décimètre* a tenth of a mètre, a *kilomètre*, the ordinary measure of road distances, one thousand mètres, a *millimètre* a thousandth of a mètre. Other measures and weights are derived from the mètre. For surface measurement the unity is the square of a mètre on each side; with the multiples square décamètre, having sides of ten mètres, and the divisions of a square decimètre, or sides of one-tenth of a mètre, etc. For land measurement, the square décamètre, containing 100 square mètres, is called an *are*, and 100 ares, or 10,000 square mètres, an *hectare*. For solids the principal measure is the cubic metre of a square mètre on each of the six faces, the same bulk of water forming the ton weight of liquids. The *litre* is a thousandth part of the ton, or a measure having a tenth of a mètre, or ten centimètres on each face. The weight unit is also derived from the measurement of liquids, a cubic centimètre, or cube of one hundredth of a mètre on each face of distilled water, at the temperature of greatest density, forming the *gramme;* a thousand grammes make the *kilogramme*, or French double pound, which is the principal commercial unity of weight. The division of the mètre and the gramme into one thousandth parts, the *millimètre* and the *milligramme*, permits calculations of great nicety, and those weights and measures are now commonly employed in the sciences and industrial arts in countries which have not adopted the metric system generally.

Comparative tables of the English equivalents of the French weights and measures are to be found in most books of arithmetic and works of reference, and it will suffice here to state that the mètre is 39·370 inches, or 1·093 yards; the litre, 61·027 cubic inches, or 1·760 pints; the hectolitre, 2·751 bushels; the gramme, 15·432 grains; the kilogramme, 32·150 ounces troy, or 2·204 pounds avoirdupois; the square mètre, 10·764 square feet; the hectolitre, dry measure, 2·751 bushels; the kilolitre, or ton measurement 35·316 cubic feet. Conversely the English inch is 0·025 metres; the yard, 0·914 mètres; the mile, 1609·31 mètres; the square yard, 0·836 square mètres; the acre, 0·404 hectares; the pint, 0·567 litres; the gallon, 4·543 litres; the bushel, 36·347 litres; the grain, 6·479 centigrammes; the ounce avoirdupois, 28·349 grammes; the pound, 453·592 grammes; the cwt., 50·802 kilogrammes. In the above equivalents decimal figures beyond three in number are omitted.

The metric system was definitely constituted by a law of the 10th December 1799, and became compulsory from November 1801, but did not apply to the currency. The famous law of the 7th Germinal year xi. (28th March 1803), however, established the monetary system on its present bases, the weight of the coin being fixed in grammes with decimal subdivisions of the franc into decimes and centimes, or tenths and hundredths of the franc. The new system had to contend with old habits and prejudice. The population continued to employ old names adapted to divisions of the new weights and measures, such as a foot of a third of the mètre, an *aune* or ell of 1·20 mètres, a pound of 500 grammes, an *arpent* or acre of two-fifths of an hectare, etc., and those infractions of the law

were tolerated by successive governments until a law was passed in 1837, interdicting, from the 1st January 1840, under severe penalties, the use of any other weights and measures than those of the metric system. The principal exceptions to the use of the metric or decimal system in France, are in the divisions of time, and the measurement of angles, for which the old numeration is preserved, and all attempts to bring those quantities into concordance with the system have been abandoned. Absolute perfection is difficult, and the original idea of taking for the standard a certain and incontestable lineal measure has not been completely realised. Since the first mètre was cast in platinum, and deposited at the archives in an iron safe, secured with four locks, other measurements of the meridian have been taken, and have proved that the real length of the quadrant is 5,131,180 *toises*, or 440 more than obtained by Delambre and Mechain. The latter of those savants is said to have himself discovered an error in his calculations, but did not dare to reveal it for fear of raising doubts on all the work of the commission. The mètre has remained as first established, in spite of that imperfection.

An international convention met in Paris in 1875, and decided on the formation of a permanent bureau of metric weights and measures. The countries represented were France, Belgium, Italy, Spain, Portugal, Sweden and Norway, Germany, Austria, Switzerland, Denmark, Russia, Turkey, the United States of America, Argentina, Peru, and Venezuela. England did not send any delegate, but gave her adhesion in 1884, and some other states, including Japan, have since joined in. The international bureau is established in a government building, in the park of St. Cloud, with a permanent staff charged to make and provide prototypes of the mètre and the kilogramme, the expense being borne in common. Besides the original mètre, preserved at the Paris archives, exact reproductions are also deposited at the Observatory, and the Conservatoire des Arts et Métiers. The international prototypes are made of 90 parts of platinum, and 10 of iridium, and have a length of 102 centimetres, the mètre being marked by indented lines at one centimètre from each end. Most of the states above named have adopted entirely the metric system, others, including England, have legalised it, while a third class of states have decimal monies, weights, and measures, not concording with the metric system, but which are a step towards it, and will facilitate a future adhesion to it. The merits of the system as a whole are so universally admitted that they do not require to be demonstrated.

T. L.

METROPOLIS, Management of (see also Companies, City of London). For purposes of local government London is divided into two distinct areas, the County of the City of London and, outside the City Boundary, the County of London, the two together forming the Administrative County of London. The former comprises the area within the old city walls, and some districts near, in all some 673 acres, about one square mile, with a population by day (1911) of 364,061 and by night 19,657. The corporation of the City of London consists of the mayor, commonalty, and citizens of the City of London. The elective bodies are the liverymen and the ratepayers. The Livery are the freemen of the city companies or gilds, which are now (1912) 77 in number, and have 8657 liverymen entitled to vote in common hall. The ratings are 12,747 in number, giving 31,680 municipal voters, the total assessment being £5,672,277. The aldermen, 26 in number—one for each ward, —are chosen by the ratepayers, and hold office for life. The alderman for the ward of Bridge Without is not elected by the ratepayers of that ward, but the seat, when vacant, is taken, generally by seniority, by one of the other aldermen, whose ward immediately elects a fresh representative. The ratepayers also elect common councilmen, varying from 4 to 16 for each ward, and amounting in all to 206, who hold office for one year only, the elections taking place annually on St. Thomas's Day. The lord mayor, who must previously have served the office of sheriff, is chosen annually, on the 29th September, by the court of aldermen, from two members of their own body selected on the same day by the liverymen in common hall. Both the selection of the livery and the choice of the aldermen usually fall upon the next in seniority. The two sheriffs are also elected by the livery. From the time of Henry I. the livery possessed the right to elect both the city sheriff and the sheriff of Middlesex, but by the Local Government Act of 1888 the last-named right was withdrawn, and the citizens now elect two sheriffs for the city.

The corporation has complete and exclusive powers of local government throughout its own area. It maintains and controls its own police, and administers justice at the Guild Hall and Mansion House. It appoints judges to hold courts of assize for criminal cases at the Old Bailey—the aldermen being justices of that court, and throughout the city, and having, besides, special powers enabling any of them to do alone any act which in any other place requires the presence of two justices of the peace. The court of aldermen holds licensing sessions for the city. It also appoints judges for the trial of civil causes in the City of London Court, and the Mayor's

Court, the latter having exclusive jurisdiction in a variety of causes arising out of city customs, and also in causes in equity, if arising entirely within the city. The court of aldermen holds separate meetings for its special duties, but for administrative purposes the aldermen sit in common council with the councillors, and have equal powers.

The County of London comprises urban and suburban districts outside the city boundaries, extending for some nine or ten miles on every side. It covers some 115·8 square miles, with a population (1901) of 4,509,349. This area was formerly without any joint administration, its local government being in the hands of the vestries of the different parishes. In 1855 the metropolitan board of works was established, with powers for drainage, lighting, cleaning, and general improvements, but by the Local Government Act (1888) this body was superseded by the London County Council, with powers of government over the same area under the title of the Administrative County of London. This body consists primarily of 118 councillors, elected by the electors of the parliamentary boroughs in the metropolis, the number of councillors for each division being double the number of members returned to parliament. The councillors elect a number of aldermen, not exceeding one-sixth of their own number. From this enlarged body they elect a chairman, a paid deputy, and a vice-chairman. All the members of the council sit together, and have equal powers. The councillors hold office for three years, and retire all together. The aldermen hold office for six years, nine or ten of them retiring every three years. At present (1912) there are 118 councillors including the chairman, and 19 aldermen.

The rateable value of the Administrative County (1911) was £44,676,713 (£39,004,436 for the County of London and £5,672,277 for the County of the City of London), including £40,937 in respect of the Inner and Middle Temple, the exact relations of which to either of the two counties have not been determined. Only the general county rate is levied by the council over the whole of the Administrative County. There is in addition a special county rate levied only in the County. This latter rate (2·25d. in the £ for 1910-11) relates to expenditure for asylums, housing of the working classes, industrial and reformatory schools, inebriate reformatories, minor county bridges, etc. The council's debt, 31st March, 1911, was £84,372,410, including £16,474,341 advanced to other authorities and still outstanding.

For judicial purposes the London County Council has power to direct, with the approval of the home secretary, the holding of quarter sessions for the county of London, and has the right to petition the crown to appoint a chairman therefor. The chairman of the county council is a justice of the peace *ex officio*.

The sheriff of the county of London is appointed by the crown in the same way as the sheriffs of Middlesex and other counties.

The scheme now (1912) operative for the establishment of an Education Committee provides that it shall consist of 50 members and include (i.) the chairman, vice-chairman, and deputy-chairman for the time being of the council, (ii.) 35 members of the council, and (iii.) 12 other persons co-opted by the council, of experience in education and acquainted with the needs of the various schools in London. Of these 12 persons, at least five are to be women.

For general criminal jurisdiction the county of London is in the district of the Central Criminal Court: a district comprising 269,148 acres, say 420 square miles, including the city, with a population (1901) of 6,101,664. The Central Criminal Court holds quarter sessions and sessions every month. For police jurisdiction the county of London is comprised, by act of 1829, in the Metropolitan Police District, which extends over a radius of 15 miles from Charing Cross, and covers 442,746 acres, or 692 square miles, not including the city, having a population (1911) of 7,233,306. The metropolitan police are under the direct control of parliament, acting through a commissioner appointed by the home secretary. The expenses are limited to the equivalent of a rate of 9d., proposed (1912) to be raised to 11d. in the £, towards which grants equivalent to a rate of 4d. in the £ are made out of the Imperial Exchequer.

Many important matters relating to the health of the metropolis, such as fever and small-pox hospitals, and the care of imbeciles, are under the control of the metropolitan asylums board, one-fourth (18 out of 73) of whose members are nominated by the local government board, the remaining 55 being elected by the different boards of guardians.

The control of the docks and the river Thames below Teddington is in the hands of the Port of London Authority, a body of 28 members, 18 being elected by payers of dues, owners of river-craft, and wharfingers, 4 appointed by the London County Council, 2 by the City Corporation, 2 by the Board of Trade, 1 by the Admiralty, 1 by the Trinity House.

The water-supply is controlled by the Metropolitan Water Board (act of 1902), which consists of 66 members, of whom 14 are nominated by the London County Council, and the remainder by interested municipal bodies.

The vestries of the different parishes within the county of London were, by the act of 1899, superseded by borough councils, to the number of 28, which consist each of a mayor and a certain number of councillors, not to exceed 60, who have power to elect aldermen not exceeding one-sixth of the number.

The lieutenancy of London is in a commission named by the crown under the privy seal, and under act of 1673, and consisting of the members and chief officers of the corporation, but not all of the councillors, and other merchants and bankers of the city who are recommended by the lord mayor. The court of lieutenants has the same powers with regard to the reserve forces as the lords lieutenant of the counties. R. W. B.

METZ NOBLAT. See De Metz-Noblat.

MEUBLES. See Immeubles.

MEYNIEU, Madame Mary (died in 1877); an Englishwoman by birth, married to a Frenchman. She became a widow after fifty years of wedded life, but continued to live in France. Highly cultivated and accomplished, she was one of the few women who have written on political economy, and she was highly successful in popularising the science.

Her principal works are: *Eléments d'économie politique*, a statement in a series of dialogues between a teacher and pupil for the use of the primary normal schools, Paris, 1839, 8vo.—*Histoire du paupérisme anglais*, 1841, 8vo.

MÉZAGUES, Vivant de (18th century), believed to be the author of a "letter" on the general condition of England, under the initials M. V. D. M., is stated by his translator to have been at the head of the finances of France (*c.* 1754-60). The object of the "letter" is to show that the wealth and trade of England were not greater than those of France. With this view the author examines into the balance of trade between England and other countries (including Ireland), the national income and debt, exchanges, imports and exports of bullion, war expenditure, etc. He concludes that England, after having been a gainer by her trade during the 17th century, was in 1761 a loser from a monetary point of view. He supports his argument by statistics from official and the best private estimates, and carefully considers objections. He calculates that the "territorial income" of England about 1760 was £20,000,000 sterling; also that from two-fifths to a third of the national debt was held by foreigners.

Bilan général et raisonné de l'Angleterre, depuis 1600 jusqu'à la fin de 1761; ou Lettre à M. L. C. D. sur le produit des terres et du commerce de l'Angleterre, par M. V. D. M., 1762; translated into English under the title *A general view of England respecting its policy, trade, commerce, taxes, debts, produce of land, colonies, manners, etc., argumentatively stated from the year 1600 to 1762, in a letter to M. L. C. D. by M. V. D. M.*, London, 1766. [See Andrew Hooke.]

[Coquelin and Guillaumin, *Dictionnaire de l'Économie politique*, Paris, 1854.—R. Giffen, *Growth of Capital*, London, 1889.] R. H. H.

MICHAELIS, Otto (1826-1890), was successively a journalist, a member of the Prussian chamber of deputies, of the imperial *Reichstag*, and a councillor of the German chancery. He was one of the most steadfast and brilliant representatives of the German free-trading party; when Prince Bismarck's leanings towards a protective policy became notorious, he resigned his office in the imperial chancery, but was placed at the head of the board of the *Invalidenfonds*. He was with Julius Faucher (*q.v.*) one of the founders of the *Vierteljahrschrift* and an honorary member of the Cobden Club.

After having published a book against the state monopoly of railways (*Das Monopol der Eisenbahnen* 1861), Michaelis later on showed himself willing to make concessions on this subject; his *Volkswirthschaftliche Schriften*, 2 vols., 1857, which deal with the management of railways, the commercial crisis of 1857, commercial speculations, public loans and banking, and his contributions to the *Vierteljahrschrift*, deserve to be noticed. In his chapter on value (*Das Kapital vom Werthe*), which first came out in the same periodical, he states that the notion of value is purely subjective, and springs from the efforts to be made in order to get possession of a thing, leaving aside the further purpose of exchange. He was a strong opponent of a fiduciary circulation of bank-notes. E. Ca.

MICHEL, Francisque (1809-1887), editor of the first volume of the Gascon Rolls (*Rôles Gascons*) in the *Collection des Documents Inédits*, of municipal records of Bordeaux, etc. His writings, chiefly on antiquarian subjects, are numerous.

His *Histoire du Commerce et de la Navigation de Bordeaux* (2 vols., Bordeaux, 1867-68), entirely based on local and on national (English and French) records, is highly esteemed and full of information on the intercourse between Bordeaux and England during the period of English dominion.

E. Ca.

MIDDLEMAN. A "middleman," in the broadest sense, is one through whose hands goods pass from one trader to another or to a consumer. Owing to the inaccurate habits of thought prevalent respecting economics, the term has acquired a dyslogistic meaning in consequence of the considerable profits which are frequently made by the persons or corporations included under it. The middleman is supposed in some mysterious and blameworthy manner to have insinuated himself between the producer and the consumer, taking an exorbitant profit from both, and various wild schemes have from time to time been devised for "eliminating the middleman" who is figured by half-educated people as a person with no real *raison d'être*, since he performs no useful function. This idea is, in the main, absurd, but like most widely spread opinions it is based on a truth. To get rid of *all* intermediate agencies between producer and consumer is a dream which even the most rabid assailant of the middleman would admit to be impossible of realisation, but there is no doubt

that in certain cases middlemen continue to obtain business long after the economic justification for their existence has ceased. To do what has always been the custom is easier than to strike out a new path, and for this reason people follow the old ways in their daily business unless a very great advantage can be shown to result from a change.

Co-operation as applied to Distribution is a device, and a very effective device, for getting rid of a number of middlemen. Various attempts have been made to "bring producer and consumer together," especially in the case of agricultural produce, the profits of the salesman, in the case of meat especially, being supposed to be excessive. They probably are in many cases; for though retail tradesmen are fierce competitors one with another in large towns, their competition does not take the form of cutting down prices to any serious extent, and in small towns a practical monopoly of the supply of such articles as meat often exists. Moreover, the strong demand arising from the wants of the big towns, especially London, tends to keep up prices, for the London salesman would be quick to take advantage of any unusual cheapness. It is, however, difficult to avoid the conclusion that middlemen are essential to nearly all businesses involving movements of commodities over considerable distances, and as there is competition even among them, their profits cannot be more, on the average, than the services rendered justify, though occasionally an excessive profit may be made for a time. W. H.

MIDDLE PRICE. Dealers on the stock exchange, when asked the price of a given security, sometimes say, "87 middle," or some other middle price, at which they are not prepared to deal, but which is half way between the prices which buyers offer and sellers are prepared to accept. A middle price is therefore not a formal Quotation (*q.v.*), although transactions are sometimes based on it (see also Margin). A. E.

MIL. The 1000th part of a monetary unit. It is perhaps more frequently applied to the United States dollar than to any other coin. The smallest United States coin issued appears to be a copper half-cent, of which $39,926.11 coined by the mint of Philadelphia were stated to be outstanding in 1894. These half-cents each = $2\frac{1}{2}$ mils. The value of the mil is about $\frac{1}{4}$ of 1 farthing.

[*Report of the Director of the United States Mint*, 1894. The mil was proposed as the smallest coin of the Decimal System (*q.v.*) Some comments on the use of the mil will be found in Bagehot, *A Universal Money*, pp. 45-62, 2nd ed. 1889.]

MILL. A mill is properly "an engine or machine for grinding or comminuting any substance" (Webster), and is an implement of great antiquity, its rudimentary form being preserved in the quern or hand-mill from time immemorial used for grinding corn, and occasionally to be met with still in remote places. At what period in the history of ancient civilisation mills of a larger construction began to be used is uncertain; but a persistent tradition, founded on a remark of Strabo's, points to the first water-driven corn mill as having been in use near the palace of Mithridates, in Asia Minor, who died 63 B.C. Such mills were introduced into Britain by the Romans, and were common throughout Europe during the middle ages. Gradually they were applied to other purposes, to grinding colours, crushing oil, and sawing stone and timber. Later still a use was found for them in connection with metal manufacture; as an alternative to hammering by hand; and in textile manufacture, in the special process of *fulling*,[1] or pounding cloth. At the time of the introduction of the modern Factory System their utility was extended in a variety of directions; and about the same time that astonishing series of mechanical inventions commenced which resulted in the possibility of *spinning*, and at length of *weaving*, by machinery. The places where these operations were performed seem to have been called at first mills or factories indifferently, partly, we may judge, because of the extension of their utilities in these directions, partly because many old mills—corn mills and fulling mills—were then turned into factories. The earlier factory acts, accordingly, made no distinction between these terms, and the original technical signification of the former seemed in some danger of being lost in this connection. Subsequently the term mill was dropped, except in certain specific relations which are defined, as *mill-gearing*, *iron mill*, but a survival of this confusion of nomenclature may still be noted in the factory districts, where that part of a textile manufactory where spinning is carried on is often spoken of as distinctively the mill, whilst the part where weaving is performed is called the factory, with obvious reference to those earlier meanings.

[John Beckman, *History of Inventions*, articles "Corn Mills," "Saw Mills" (Bohn's edition).—R. W. Cooke-Taylor, *Introduction to a History of the Factory System*, ch. i.] R. W. C. T.

1 "The operation of *fulling* bore a sufficiently near resemblance to the earlier and proper processes of mill work, not to appear utterly foreign from the older conception of a mill, and was in fact sometimes called 'milling,' in obvious accord with this view. Soon, however, the term began to include other processes more remote. In 1551 complaint is made to parliament of the establishment of 'gigge mills'—contrivances, that is, for raising a *pile* or *nap* on cloth, a process, therefore, wherein little trace of the original meaning of the word 'mill' remains; and at length *winding*, *spinning*, and a variety of operations dealing with the treatment of fibrous material are found spoken of as performed in mills; operations wherein the original technical signification is altogether lost" (Cooke-Taylor, *Introduction to History of Factory System*, p. 11).

MILL, JAMES (1773-1836) was born in the village of Northwater Bridge, Forfarshire. His father was a shoemaker. His early years were exempted from the drudgery of manual labour by the discerning partiality of his mother. He was sent to the university of Edinburgh at the age of seventeen, and having completed the usual studies, became licensed as a preacher. But abandoning this career, Mill went to London in 1802, and supported himself by literature. He married in 1806, and in course of time had a family of nine children—"conduct than which nothing could be more opposed," as his son says, "to the opinions which, at least at a later period of his life, he strenuously upheld." Struggling and burdened as he was, he had the energy to compose a great book, *The History of India*. The publication of this work in 1818 led to Mill's obtaining a lucrative appointment in the India office. His position in the office continued to rise in dignity and emolument up to his death.

Mill's earliest work was economic, *An Essay on the Impolicy of a Bounty on the Exportation of Grain and on the Principles which ought to regulate the Commerce of Grain*, 1804; a rare pamphlet which, from M'Culloch's notice of it, seems to have referred to the restrictions on the trade between England and Ireland. In 1807 he wrote *Commerce defended: an Answer to the Arguments by which Mr. Spence, Mr. Cobbett, and others, have attempted to prove that Commerce is not a source of National Wealth*, which led to his acquaintance with Ricardo. The advantages of the territorial division of labour are well expounded; but the following view of the gain by international exchange appears less orthodox: "Whenever a cargo of goods of any sort is exported, and a cargo of other goods bought with the proceeds of the former is imported, whatever the goods imported exceed in value [*i.e.* money-value, as the context shows] the goods exported beyond the expense of importation is so much clear gain to the country." In 1808, reviewing Thomas Smith, "Money and Exchange" in the *Edinburgh Review*, Mill asserts the principle that money is a commodity, and thus describes its uses. "First we go to market with money. Secondly, we account by means of it. . . . Abstract ideas or ideal standards are of no use in going to market," or for any other purpose. Some years later (1816-23) Mill contributed several articles to the supplement to the *Encyclopædia Britannica* (1823), of which the most famous, criticised by Macaulay, *Edinburgh Review*, 1829, is that on *Government*. The articles in the Supplement which most deserve notice here are on *Banks of Savings, Beggars, Benefit Societies*, and *Colonies;* containing strong assertions of the Malthusian doctrine (see especially p. 246 of *Supplement*, vol. i.). The article on *Economists* treats only of the political principles of the French school.

Much of the matter contained in the writings which have been referred to is presented in a summary form in Mill's masterpiece, *Elements of Political Economy*. This composition originated in 1819, as J. S. Mill tells us, in instructions given to him by his father in the course of their daily walks. The abstracts of these lessons, prepared by the son, served the father as notes from which to write his book, which was published in 1821. A second edition—considerably altered—appeared in 1824; a third in 1826. Several of the alterations in the third edition were founded on criticisms made by J. S. Mill and his friends. Although the book, in J. S. Mill's words, "has now for some time finished its work," it is still interesting as a type of the classical political economy (J. S. Mill's *Autobiography*, p. 121). The capable author proposing "to compose a schoolbook of political economy" (Preface) "an epitome of the science" (ch. iii. § 10), and professing "to have made no discovery" (Preface), is naturally regarded as the interpreter of his contemporaries, especially of Ricardo his intimate friend (cp. Prof. Ashley on the *Rehabilitation of Ricardo, Economic Journal*, vol. i. pp. 478-479). Admirable as the work is, considered as a summary representation of received theories, there are two features of the original which seem to be exaggerated in the miniature picture (1). With M'Culloch, James Mill represents value as depending wholly on quantity of labour (cp. M'Culloch, *Principles of Political Economy*, pt. iii. § 1). He explains away the part played by *waiting* (as we should now say). "If the wine which is put in the cellar is increased in value one-tenth by being kept a year, one-tenth more of labour may be correctly considered as having been expended upon it." . . . "How then can it [time] create value? Time is a mere abstract term. It is a word, a sound" (*Elements*, 2nd ed. p. 97-99). This view is criticised with just severity by S. BAILEY (*Critical Dissertation on Value*). (2) The theory of population as presented by James Mill appears particularly dismal; owing partly to his very precarious "proof that capital has a less tendency than population to increase rapidly" (*Elements*, ch. ii. § 2, art. 3), partly to his not taking sufficient account of improvement in the arts of production. "The grand practical problem, therefore, is to find the means of limiting births." A more original feature is the proposal to tax additions to rent—J. S. Mill's "unearned increment."

Upon the whole political economy, as treated by James Mill, may afford one of the advantages which he claims for the science in the dialogue entitled "Whether Political Economy is useful" (*London Review*, 1836) namely, contemplative

pleasure. Even Dr. Ingram allows to the *Elements* "the character of a work of art." But Mill's work does not afford another advantage which he claims for political economy in the same dialogue, namely, a "comprehensive commanding view" such as that by which a general is enabled to realise his practical purpose. James Mill's work in political economy, as in politics, seems to be vitiated by the excessive use of deductive reasoning—what his son calls the geometrical method (*Logic*, bk. vi. ch. viii.). His principal services to political economy were indirect—to have instigated Ricardo to write (see J. S. Mill's *Autobiography*) and to have been the father and the teacher of J. S. Mill.

[*Life*, by Professor Bain, 1882.—*J. S. Mill*, by Professor Bain (full of references).—MacVey Napier, *Correspondence*.—J. S. Mill's *Autobiography*.—Mrs. Grote's *Personal Life of George Grote*, pp. 21-25. See an exposition of fallacies on rent tithes, and containing an examination of Mr. Ricardo's theory of rent, viz. the doctrine of the impossibility of a general glut and other propositions of the modern school. . . . Being in the form of a review of the third edition of Mr. Mill's *Elements of Political Economy*, by Perronet Thompson. —*History of Theories of Production and Distribution*, by E. Cannan.] F. Y. E.

MILL, JOHN STUART.

Early Works, p. 756; *Essays on some Unsettled Questions of Pol. Ec.*, p. 756; *Principles of Political Economy*, p. 757; Other Works, p. 763.

John Stuart Mill (1806-1873), was the eldest son of James Mill, by whom he was educated. The teacher was exacting, the pupil precocious; and John, at a marvellously early age, attained proficiency in all the principal branches of learning, particularly the speculative sciences. At the age of thirteen he received from his father peripatetic lectures on political economy; and it must have been about the same period that, in his own words, "Mr. Ricardo invited me to his house and to walk with him in order to converse upon the subject" (*Autobiography*, p. 54). At the age of sixteen he wrote in the *Traveller* in defence of Ricardo and James Mill, his first appearance in print. He contributed frequently to the *Westminster Review*, which was started in 1824, thirteen articles, he says (*ibid.* p. 97), of which only some are specified by him. Those on the game laws, the law of libel, and the corn laws, attest the versatility and precociousness of the writer. Among the "reviews of books of political economy," which he speaks of having written, may probably be placed the review of the *Critical Dissertation on Value* (by S. Bailey) in the fifth number of the *Westminster* (Jan. 1826). The relation of cost of production to value is, according to the writer, like the relation of the pendulum to a the movement of a clock—a regulator, not a cause. "Demand is the cause of value." The issue between the author of the *Dissertation* and James Mill as to the influence of Distance in Time on value is avoided.

Other youthful essays were published in the *Parliamentary History and Review*, the first two numbers of which relating to the sessions 1825 and 1826 are to be found in the Bodleian. The first contains—beside the article on the *Catholic Association*, acknowledged by Mill (*Autobiography*, p. 118)—some remarks on combination and combination laws (*Review*, for 1825, p. 730), which may perhaps be attributed to Mill. The theory that "the rate of wages must in the long run depend on the relation between the capital of a country and its population," is employed to prove the impossibility of raising general wages by combination. The second number contains an article headed *Paper Currency — Commercial Distress*, justly referred to in the *Autobiography* (*loc. cit.*), as an "elaborate essay." The remarks on theory and experience (*Review*, for 1826, pp. 654-659), and on the "double standard" (*Hist.*, p. 659) are characteristic. This essay and that on the Reciprocity principle in Commerce are described by Mill (in his *Autobiography*) as "original thinking." They were not, however, included by him among the articles which he has republished in his *Dissertations and Discussions*. Among ephemeral writings which have not been reprinted may be noticed the *Notes on Newspapers* in the *Monthly Repository* of 1834. They evince that rare union of qualities which he himself has characterised as "practicality" and devotion to "large generalisations" (*Autobiography*, p. 190). Referring to the then burning question of trades unions, he maintains that workmen cannot keep up the rate of wages by combination, but that they ought not to be prevented from learning this by experience (*Monthly Repository*, 1834, pp. 247, 366, 435).

Meanwhile the young philosopher had cultivated his dialectic powers by taking part in debating societies, formed largely but not exclusively of the followers of Bentham. The picked band which used to meet in the morning in Grote's house "brought out new views of some topics of abstract political economy." To this origin Mill refers the first and fourth of the essays, which are contained in the *Essays on some Unsettled Questions of Pol. Econ.* . . . These *Essays* were written in 1829 and 1830, but (with the exception of the fifth, which appeared in the *Westminster Review*) they did not find a publisher till 1844. The *Essays* deserve to be studied as anticipating, and sometimes transcending, the *Political Economy*.

Of the first essay the substance, and in large part the very words have been embodied in the great chapter in the *Political Economy* on "International Values" (bk. iii. ch. xix.), and in the

important section which deals with protection (*ibid.* bk. v. ch. iv. § 6). With this should be read the passages in the preface to the *Essays*, which expresses the opinion that the relaxation of non-protective duties beyond what may be required by the interest of the revenue should in general be made contingent upon the adoption of some corresponding degree of freedom of trade by the nation from which the commodities are imported. In the second essay the influence of consumption upon production is stated more fully than in the passages of the *Political Economy* which are below (p. 758) referred to as corrective of a wrong interpretation of the doctrine "Demand for commodities is not a demand for labour." In the third essay there is obtained a definition of wealth as consisting of "permanent sources of enjoyment," and a corresponding definition of productive labour, more philosophical perhaps than the definitions which in deference to popular opinion have been adopted in the *Political Economy* (bk. i. ch. 3). The fourth essay explains and corrects Ricardo's doctrine that "profits depend upon wages; rising as wages fall and falling as wages rise." The justice of the correction will be evident if we regard "wages" as paid in a money of which the unit is a product of a constant quantity of labour (Ricardo, *Pol. Econ.*, ch. 1, § 6). But this monetary standard is not quite perfect, and the Ricardian proposition is not quite true, unless we use "labour" as short for "effort and sacrifice," and take account of variations in the quantity of *abstinence* or waiting which is required for the production of a unit of the standard (cp. *Memorandum on variations in the value of the Monetary Standard*, Report of the British Association, 1889, § vii.) This refinement is reproduced in the *Political Economy* (bk. iii. ch. xxvi. § 3, but not in the corresponding passage bk. ii. ch. xv. § 7). In the fifth essay the not very epigrammatic definition of *Political Economy* agrees with that which is adopted in the "Preliminary Remarks" of the *Political Economy*. Discussing the method of the science, Mill holds the balance between abstract reasoning and observation. The *a priori* method is the only certain or scientific mode of investigation. But he who does not "sift and scrutinise the details of every specific experiment must rest contented to take no share in practical politics, to have no opinion, or to hold it with extreme modesty," on the applications of his doctrines. There is a most weighty caution against the "danger of *overlooking* something." The only remedy is to place oneself at the point of view of an opponent, and either to discern what he sees or thinks he sees, or make out clearly that it is an optical delusion. A beautiful example of this procedure is afforded in the second of the *Essays*, where Mill points out that the descriptions which have been given of OVER-PRODUCTION are applicable to a commercial crisis.

The method of political economy was further elucidated in the *Logic* published in 1843. His dominant idea is thus expressed: "I always regarded the methods of physical sciences as the proper models for political" (*Autobiography*, p. 165; cp. *ibid.* p. 160).

The combination of *a priori* reasoning from general propositions with specific verification, the direct deductive method, which has proved so successful in mathematical physics is prescribed for political economy (*Logic*, bk. vi. ch. ix.). It is a question whether this view was, or could consistently be, retained by Mill, when he began to doubt the universality of the principle of self-interest, which he once had regarded as the foundation of economic reasoning (*Essays*, p. 138), when under the influence (see also A. COMTE) of the St. Simonians "his eyes were opened to the very limited and temporary value of the old political economy" (*Autobiography*, p. 166), and when, under a more intimate influence, he looked forward to a time when "it will no longer either be, or be thought to be, impossible for human beings to exert themselves strenuously in procuring benefits which are not to be exclusively their own" (*ibid.* p. 230 *et seq.*; cp. on the ultimate premisses of Political Economy, Marshall, *Princ. of Econ.* 5th ed. bk. i. ch. ii. §§ 4, 5).

Thus prepared, Mill began his treatise on *Political Economy* in 1845, and finished it in 1847 with marvellous celerity. An analysis of this classical work may be useful.

J. S. Mill's *Principles of Political Economy*, for a work that has been so much read, has been but little commented on. To remedy, in however slight a degree, this deficiency is the design of the following paragraphs.

The preliminary remarks contain a sketch of the progress and a description of the object of political economy. The definition of wealth as "all useful or agreeable things which possess exchangeable value," leaving in uncertainty the question "whether immaterial products are to be considered wealth," should be compared with the discussion of this question in Mill's *Unsettled Questions* (Essay 5), and in one of the chapters of his *Political Economy* (bk. i. ch. iii. § 3). In his earlier view, the "skill and the energy and perseverance of the artisans of a country are reckoned part of its wealth, no less than their tools and machinery" (*ibid.*); but in the later treatise the term is applied only to "what is called material wealth."

The first inquiry about wealth relates to its cause. "The requisites of production are two: labour and appropriate natural objects" (bk. i. ch. i. § 1, par. 1). These are the "primary and universal requisites" (bk. i. ch. i. § 1, par. 1). But since "there is another requisite, without which no productive operations beyond the rude

and scanty beginnings of primitive industry are possible" (bk. i. ch. iv. § 1, par. 1), we may say that "the essential requisites of production are three: labour, capital, and natural agents" (bk. i. ch. x. § 1, par. 3; cp. AGENTS OF PRODUCTION).

A "general survey" (ch. vii., first sentence), of the requisites of production, occupies the first six chapters. The "conceit . . . that nature lends more assistance to human endeavours in agriculture than in manufactures," is refuted in the first chapter. In the first section of the second chapter it is shown how "an article fitted for some human use" (an article of the "first order," as it is now the fashion to say)—such as bread—is produced, partly by labour employed directly about the thing itself—such as that of the baker—and partly by the indirect labours of the reaper, the ploughman, the ploughmaker, who all "ultimately derive the remuneration of their labour from the bread or its price." This important passage is referred to at a more advanced stage, as setting forth the "component elements of cost of production" (bk. iii. ch. iv. § 1). The modes in which labour is indirectly instrumental to the production of a thing are analysed in the remainder of the second chapter; the term "indirect," it may be observed, sometimes importing simply the relation of means to end (§ 1, § 3, par. 1); sometimes, as in the case of savants (§ 8, last par.), that "the material fruits, though the results, are seldom the direct purposes of the pursuits of the savants, nor is their remuneration in general derived from the increased production which may be caused incidentally . . . by their discoveries" (cp. § 7, par. 1).

Capital is defined as the physical requisites of production which are the products of labour (ch. iv. § 1, par. 12; cp. ch. x. § 1, par. 3). The term admits of nice divisions which are traced in the fourth chapter. The "fundamental propositions respecting capital" which form the fifth chapter, may be described without much exaggeration in Prof. Nicholson's words, as "a strange combination of axiom and paradox, of error exposed and truth suppressed, of practical wisdom and unreal hypothesis" (Nicholson's *Principles*, bk. i. ch. vi. § 7). More than one of the propositions at least "expresses his [Mill's] meaning badly"; as Prof. Marshall says (*Principles of Economics*, 5th ed. Appendix J.).

The proposition which has most "exercised the ingenuity of all subsequent writers" (Nicholson), is the fourth, that "demand for commodities is not demand for labour." The following is a contribution to the interpretation of this *locus vexatissimus*.

Mill does not mean to deny that consumption is the motive to production. The fact that desire evokes labour is constantly present to him (see Preliminary Remarks, two passages in the middle, pp. 13, 19, ed. 1878, bk. i. ch. vii. § 3; bk. i. ch. viii. § 2, last par.; bk. i. ch. xiii. §§ 1 and 3; bk. iii. ch. xvii. § 5, and cp. *Unsettled Questions*, Essay 2). He may be credited with making two assertions, one correct and one not so. The true lesson to be derived from the passage is that capitalisation is apt to be increased by the postponement of the consumption (Marshall, *loc. cit.*). But it is erroneously implied that "to spend money on the direct hire of labour is more beneficial than to spend it on hiring commodities" (Marshall). *Ceteris paribus* it comes to much the same whether a rich individual spends his money on "velvet" (Mill's favourite instance), or in payment of workmen to roll the "velvet green" (Ruskin). The most serious refutation of this error is that which forms the appendix to bk. iv. of Prof. Simon Newcomb's *Political Economy*. The great difficulties which Mill's doctrine presents may further be illustrated by the parallel passage in Fawcett's *Political Economy*, and by the explanations of the doctrine which are offered by Prof. Sidgwick (*Pol. Econ.*), Prof. Laughlin (Edition of Mill), Mr. Herbert Thompson (*Theory of Wages*), and others.

After the general survey of the requisites of production (bk. i. ch. vii. § 1), we "advance to the second great question in political economy, on what the degree of productiveness of these agents depends" (*ibid.*). Among causes of superior productiveness (chs. vii. viii.) a prominent place is given to combination of labour, or co-operation, including division of labour as a species. Most of the advantages attending division of labour are enumerated in the chapter on co-operation. One advantage described by Jevons as the "multiplication of services" in cases where "nearly the same time and labour are required to perform the same operation on a larger or on a smaller scale" (Whateley, *Lectures on Political Economy*, lecture 6), is postponed by Mill to the chapter on "production on a large and on a small scale" (bk. i. ch. viii.) Two important cases of production on a large scale are presented by joint-stock companies (*ibid.* § 2), and the *grande culture* in agriculture (§ 4). The distinction which Mill draws between gross and net produce per acre (*ibid.*) is vital.

Having considered the means by which the efficacy of the agents of production is promoted (bk. i. ch. x. § 1, par. 1), we proceed to consider the "law of the increase of production" with respect to each of the agents (*ibid.* par. 4). The term "law" applied to the rough generalisations which alone are possible on these subjects is open to criticism (cp. Sidgwick, *Pol Econ.*, bk. i. ch. vi.).

"The increase of labour is the increase of mankind, of population;" the theory of which is here opened (ch. x.).

The law of the increase of capital (ch. xi.) involves the "effective desire of accumulation," which has been considered in the article on DISTANCE IN TIME AS AN ELEMENT OF VALUE.

The "law of the increase of production from land" (ch. xii.) is what is now called the *law of diminishing returns*. The relation of this law to that of *increasing returns* is thus well expressed by Mill (*ibid.* last par.): "All natural agents which are limited in quantity are not only limited in their ultimate productive power, but, long before that power is stretched to the utmost, they yield to any additional demands on progressively harder terms. This law may, however, be suspended or temporarily controlled by whatever adds to the general power of mankind over nature, and especially by any extension of their knowledge, and their consequent command of the properties and powers of natural agents." The "consequences of the foregoing laws," the dangers of over-population, are set forth in a concluding chapter (bk. i. ch. xiii.). Of Mill's gloomy views on this subject, Prof. Nicholson has said, "surely in the whole range of social philosophy it would be difficult to discover a more striking instance of the overbearing influence of a dominant idea"—considering that Mill himself has given "what is probably the most complete account yet published of the modes in which this law of diminishing returns may be counteracted" (Nicholson, *Principles*, bk. i. ch. x. § 4).

"The principles which have been set forth in the first part of this treatise (bk. i.), are in certain respects strongly distinguished from those on the consideration of which we are now about to enter. The laws and conditions of the production of wealth partake of the character of physical truths." But the distribution of wealth which forms the subject of the second book, is "a matter of human institution solely." "Society can subject the distribution of wealth to whatever rules it thinks best" (bk. ii. ch. i. § 1, cp. *Autobiography*, p. 246). The distinction thus drawn is objected to by Prof. Nicholson (*Principles*, bk. ii. ch. i.) and others, *e.g.* Mr. J. H. Levy, *Outcome of Individualism*, p. 16. But there is surely a very intelligible difference, in degree at least, between the two classes of "laws."

Considering the different modes of distributing the produce of land and labour, Mill compares the institution of private property with communism and socialism, and suggests that "the decision will probably depend mainly on one consideration, viz. which of the two systems is consistent with the greatest amount of liberty and spontaneity" (bk. ii. ch. i. § 3). The following weighty sentence condenses much that Mill has taught in his book on *Liberty*—"it is yet to be ascertained whether the communistic scheme would be consistent with that multiform development of human nature, those manifold unlikenesses, that diversity of tastes and talents and variety of intellectual points of view which not only form a great part of the interest of human life, but, by bringing intellects into stimulating collision, and by presenting to each innumerable notions that he would not have conceived of himself, are the mainspring of mental and moral progression" (*Pol. Econ.*, bk. ii. ch. i. § 3 end).

Before condemning private property we must consider it not as it is, but as it might be in its best form (*ibid.* penultimate par., cp. L. H. Courtney, "Difficulties of Socialism," *Economic Journal*, vol. i.); which implies the "guarantee to individuals of the fruits of their own labour and abstinence," but "not of the fruits of the labour and abstinence of others transmitted to them without any merit or exertion of their own" (*ibid.*); not unlimited power of bequest, nor unrestricted property in land, nor any proprietary rights in abuses (ch. ii.).

"Private property being assumed as a fact" (ch. iii. § 1, par. 1); we go on to consider the distribution of produce between the three classes "whose concurrence, or at least whose permission, is requisite to production," viz. landowners, capitalists, and labourers—not necessarily different persons (ch. iii.).

"Under the rule of individual property the division of the produce is the result of two determining agencies, competition and custom" (ch. iv.). The cautions with respect to the imperfect degree in which "the natural effect of unimpeded competition" is realised (*ibid.* § 3), may be read with other passages relating to method; such as bk. iii. ch. i. § 5 (guarding against "improper applications of the abstract principles of political economy") bk. ii. ch. xvi. § 4; "the truths of political economy are truths only in the rough"—bk. iii. ch. iv. § 6 (on the danger of "sweeping expressions").

Mill's attempt in the later chapters of the second book to deduce the action of competition on distribution before he has formulated the law of supply and demand which governs that action, is open to grave objection (Marshall, *loc. cit.*).

Mill's recognition of the empirical or historical method is abundantly illustrated by the chapters on *Peasant Proprietorship and Métayers* (bk. ii. chs. vi. vii. viii.), which teem with evidence; out of which, the extracts from SISMONDI, Michelet, and Arthur YOUNG may be selected as of permanent interest.

From métayers Mill proceeds to cottiers (ch. ix.), with especial reference to Ireland; and argues that, almost alone among mankind, the cottier is in this condition that "he can scarcely be either better or worse off by any act of his own." The "means of abolishing cottier tenancy," proposed by Mill, have partly passed into legislation. The principle of judicial

rents is thus sanctioned: "rent paid by a capitalist who farms for profit, and not for bread, may safely be abandoned to competition; rent paid by labourers cannot, unless the labourers were in a state of civilisation and improvement which labourers have nowhere yet reached, and cannot easily reach under such a tenure."

It might be difficult to answer the question —why upon the same principle the bargain between employers and labourers should not be sheltered from competition. One answer is afforded by the wage-fund theory, which is stated at the beginning of the chapter on wages (bk. ii. ch. xi.). It was subsequently renounced by Mill (see below, p. 763). But that theory, though left standing in the latest editions of the *Political Economy*, was recanted by Mill in his review of Thornton; when, as Prof. Marshall thinks, "he took to himself blame for confusions of thought of which it is not certain that he had been guilty" (*Principles of Economics*, note, 2nd ed. ch. ii. bk. vi., and 5th ed. App. J.).

The overthrow of the wage-fund theory does not involve the fall of Mill's practical conclusions concerning wages. They are at best strengthened and heightened by that theory (see *e.g.* ch. i. § 6, penultimate par., ch. xii. § 1, pt. iii.). But it is rather on the theory of population set forth in the first book that Mill grounds his rejection of "popular remedies for low wages" (ch. xii.), and his own prescription which is, that the overcrowding of the labour market is to be prevented by "a due regulation of the numbers of families" (ch. xiii.).

Among accessory recommendations should be noticed Mill's preference for an heroic measure, "a sudden and very great improvement in the condition of the poor" (ch. xii. § 4, pt. iv.; ch. xi. § 2, last par.; ch. xiii. § 3, par. 1, § 4, par. 3). "Small means do not merely produce small effects, they produce no effect at all" (ch. xiii. § 4, par. 3).

The chapter on differences of wages (bk. ii. ch. xiv.), in different employments, corrects Adam SMITH's classical exposition of the subject. The theory of non-competing groups, commonly ascribed to CAIRNES, is implied in § 2 (as pointed out in Prof. Marshall's article in *Fortnightly Review*, 1874). The short passage on the wages of women (§ 5 and end of § 4), has been little improved on.

The chapter on profits is free from certain errors which have been attributed to the classical economy. The function of superintendence is recognised (§ 1). Absolute equality of profits is not postulated. "That equal capitals give equal profits, as a general maxim of trade, would be as false as that equal age or size gives equal bodily strength; or that equal reading or experience gives equal knowledge. The effect depends as much upon twenty other things as upon the single cause specified." Cliffe LESLIE himself could say no more (§ 4). In the last section of the chapter, the definition of "cost of labour" demands attention (cp. bk. iii. ch. xxv.), and *Unsettled Questions* referred to above, p. 756.

The chapter on rent (bk. ii. ch. xvi.), taken with the subsequent chapter on *Rent in Relation to Value* (bk. iii. ch. v.), forms a luminous statement of the Ricardian theory. Yet notwithstanding his apparent clearness, Mill is really "a little inconsistent," as Prof. Marshall has said (*Economic Journal*, vol. iii. p. 86), on the fundamental question whether rent enters into the cost of production when there does not exist a no-rent margin of land. The affirmative is distinctly asserted (bk. iii. ch. v. § 2, par. 3); and elsewhere (bk. ii. ch. ii. § 2, par. 1), it is implied that there is an essential distinction between "countries fully occupied," and those which are not. Whereas the distinction appears to be unessential in an earlier passage (bk. ii. ch. xvi. § 4). Rent is said to be an "element of cost of production," under peasant production (bk. iii. ch. vi. § 2).

At length, at the beginning of bk. iii., the theory of value is introduced. Mill's definition of the "value or exchange value of a thing" as its general power of purchasing, the command which its possession gives over purchasable commodities in general" (bk. iii. ch. i. § 2), suggests something deeper than a mere ratio (see EXCHANGE, VALUE IN).

Mill's threefold classification of valuables (ch. ii. § 2; cp. DIFFICULTY OF ATTAINMENT) has been criticised as omitting the category of things which are produced in greater quantities at a less cost. Moreover the first class "things of which it is physically impossible to increase the quantity beyond certain narrow limits," of which the characteristic is that "the value depends on the demand and the supply," is defined in terms too narrow to include all the objects which possess that attribute, viz. labour and articles of foreign trade (bk. iii. ch. ii. § 5, last par.), and loanable capital (bk. iii. ch. xxiii. § 1).

The general theory of demand and supply seems to be stated by Mill as clearly as is possible without the aid of mathematical apparatus (bk. iii. ch. ii. §§ 3 and 4). Distinct intimations of the phenomenon which would now be described as the greater or less elasticity of the demand curve are to be found (bk. iii. ch. ii. § 4, par. 1; *ibid.* ch. xviii. § 8, referring to "extensibility of demand").

The third and fourth chapters of the third chapter are concerned with "necessary" (ch. iii. § 1) value, that which depends on *cost* of production. The different senses in which Mill uses cost may be distinguished by observing that the term is applied sometimes (1) to the efforts and sacrifices attending production, some-

times (2) to the pecuniary equivalent of the same (the "expenses" of production in Prof. Marshall's phrase); and that the expenditure, whether in the way of labour or of money, may relate either (*a*) to the finished commodity, or (*b*) to the workman's part therein, exclusive of the capitalist's (and entrepreneur's) effort and sacrifice or the (pecuniary remuneration thereof). For instance, 2 (*a*) must be understood when it is said that "Profits as well as wages enter into the cost of production which determines the value of produce" (bk. iii. ch. iv. § 4, par. 1). The following are instances of (*b*): bk. ii. ch. xv. § 7; bk. iii. ch. iii. § 1, par. 1, ch. iv. § 1. In connection with international trade *cost* is used in sense 1 (bk. iii. ch. xviii. § 9).

The theory of value having been summed up (bk. iii. ch. vi.); the second volume enters on the subject of money. The functions of money described by Jevons as a "measure of value" a "medium of exchange" and "a standard for deferred payments," are in other words stated in the first chapter of the second vol. (bk. iii. ch. vii. §§ 1, 2). The relation between demand and supply and cost of production is made particularly clear in the case of money (bk. iii. chs. viii. and ix.). The "quantity-theory" of money and its limits could not be better stated than in the proof which is given of the antithetical statements: "That an increase of the quantity of money raises prices, and a diminution lowers them, is the most elementary proposition in the theory of currency, and without it we should have no key to any of the others" (bk. iii. ch. viii. § 4): "That the value of the circulating medium . . . is in the inverse ratio of the quantity" is to be received with "qualifications which, under a complex system of credit like that existing in England, render the proposition an extremely incorrect expression of the fact" (ch. viii. end). However, objection has justly been taken to the statement that, "the natural and average prices of commodities are not affected by credit" (ch. xii. § 1, par. 1).

The chapters on a "double standard" and "on a measure of value" (chs. x. xv.), may be selected as bearing on questions of great interest at present. In the former, Mill does not consider *international* bi-metallism. In the latter, he seems to contemplate two of the principal methods of measuring a change in the value of money: viz. the labour and the consumption standard (see INDEX NUMBERS). With reference to Mill's disparaging remarks on "the necessary indefiniteness of the idea of general exchange value" (ch. xv. § 1), Prof. Sidgwick has pointed out (*Pol. Econ.*, bk. i. ch. ii. § 3) that Mill himself has employed some such conception in the passage where he maintains that during the last five years of the French war "the value of the standard itself was very considerably raised" (Mill, *Pol. Econ.*, bk. iii. ch. xiii. § 7).

The chapter on "some peculiar cases of value" is of peculiar interest as showing Mill's conception of the relation between "cost of production" and "a law of value anterior to cost of production, and, more fundamental, the law of demand and supply"; which "when cost of production fails to be applicable . . . steps in to supply the vacancy" (bk. iii. ch. xvi. § 1).

The antecedent law of supply again "steps in" in the theory of international values (ch. xviii. § 1). The great chapter on this subject may be divided into two parts, the original draft (§§ 1-5) and the additions suggested by "intelligent criticisms," chiefly Thornton's (§ 6 *et seq.*). The first part deals mainly with two problems (1) the case of a trade being established—a "barrier" (COURNOT) being removed—between two countries (§§ 2-3), and (2) the case of an already established trade being facilitated by an improvement in the process of manufacture of an export. In the latter case benefit does not necessarily accrue to the country in which the improvement has taken place (§ 5). In both cases it may be objected that benefit is estimated by an improper measure, that of exchange-value (see *Theory of International Values*, pt. i., by Prof. Edgeworth, *Economic Journal*, vol. iv. pp. 35, 424, 606).

Of the second part of the chapter (§§ 6-9) it is well said by a high authority on international trade: "Nothing is gained by the laborious and confusing discussion" (Bastable, *International Trade*, p. 29 n.). The introduction justifying the addition is particularly objectionable. "It is conceivable that the conditions might be equally satisfied by every numerical rate which could be supposed" (§ 6, last par.). "The equation of international trade" would thus be a very odd sort of equation!

Reinforced by the principles of international trade, Mill returns to the theory of money (chs. xix.-xxii.). He continues the subject of international trade in the chapter on "the competition of different countries in the same market" (criticised in part iii. of Prof. Edgeworth's theory of international trade, *Economic Journal*, vol. iv.).

It is impossible here to notice in detail the many detached topics which are treated in bk. iii. The "rate of interest" (ch. xxiii.) has already been referred to as a case of demand and supply, rather than "necessary" value which depends on cost of production. In the immediately following chapter, by a not very obvious transition, the rival theories respecting the influence of bank issues on prices—the so-called currency theory and banking principle—are discussed with moderation (see Walker, *Money*.—Cp. FULLARTON).

The Dynamics of Political Economy (bk. iv. ch. i. § 1) is the subject of the next book. It is attempted to compound the counteracting

tendencies which we now call the law of decreasing and the law of increasing returns; though Mill will not allow that "even in manufactures increased cheapness follows increased production by anything amounting to a law" (*ibid.* ch. ii. § 2). Considering the three factors of industrial progress, capital, increase of population, and improvements in production, Mill inquires how the increase of one or more of these affects wages, profits, and rent (*ibid.* ch. iii.). For example, one case is: Capital increasing, population and the arts of production stationary. In this case wages will rise, profits will fall, rent will rise if the labourers consume more, or more costly, food (*ibid.* § 2). The case of arts of production progressive, capital and population stationary, presents most difficulty (*ibid.* § 4). *Primâ facie* wages would rise, profits would be unaffected, rent would fall. The Ricardian paradox that landlords may be injured by agricultural improvements is supported by reasoning which, as pointed out by Prof. Marshall (*Principles of Economics*, 5th ed., App. L.), is deficient in generality. Attention should be called to the generalisation contained in the following passage: "It is quite in accordance with common notions to suppose that if, by the increased productiveness of land less land were required for cultivation, its value, like that of other articles for which the demand had diminished, would fall" (bk. iv. ch. iii. § 4). Here a problem of distribution is treated simply as one of value; and indeed throughout the chapter there is, as Marshall has pointed out (*Princ. of Econ.* note to ch. ii. bk. vi. 2nd ed., App. J., 5th ed.), "scarcely any trace of those confusions in his discussion of the theory of distribution" which disfigure the second book.

The chapters (chs. iv. and v.) on the "tendency of profits to a minimum," are important as bearing on the question: How far is it safe for the working classes to press on the gains of the saving classes (see Cairnes, *Leading Principles*, bk. ii. and cp. Marshall, *Economics of Industry*, 2nd ed. bk. ii.).

The chapter on the stationary state (ch. vi.) is particularly characteristic of the author. Of an increase of population he says, "even if innocuous, I confess I see very little reason for desiring it."

The last chapter of the fourth book "on the probable futurity of the labouring classes," enjoys the distinction of being "entirely due," according to a statement in the *Autobiography*, to Mrs. Mill. Her hand is perhaps to be traced in the delicately ironical description of what may be called the aristocratic theory of the relation between the great and the labouring poor—"a theory also applied to the relation between men and women" (ch. vii. § 1). The principal hope which the Mills hold out for the futurity of the labouring classes is productive co-operation—a hope which does not seem at present in the way of being fulfilled. There are many now who disagree with the favourable estimate of *competition*, which concludes the chapter. "If the slopsellers and others of their class have lowered the wages of tailors, and some other artisans, by making them an affair of competition instead of custom, so much the better in the end."

The fifth book treats of *government;* the functions of which are described with a freedom which might not have been expected from the son of James Mill; "the admitted functions . . . embrace a much wider field than can easily be included within the ring-fence of any restrictive definition." As explained in the first chapter (par. 2, § 3), the "necessary" and acknowledged functions (1) are first considered (chs. ii.-ix.); then (2) "optional" interferences of government (*a*) grounded on erroneous theories (ch. x.); (*b*) really advisable (ch. xi.). Of the chapters relating to the "necessary" functions, five (chs. ii.-vi.) are devoted to taxation. In the chapter on the general principles of taxation, "equality of sacrifice" is assumed as the first principle (ch. ii. § 2). In applying this principle to progressive taxation, Mill employs considerations which would now be connected with the doctrine of "final utility" (ch. ii. § 3, par. 2). (See FINAL DEGREE OF UTILITY.) That doctrine had been asserted by him more explicitly in an earlier passage: "the difference to the happiness of the possessor between a moderate independence and five times as much, is insignificant when weighed against the enjoyment that might be given . . . by some other disposal of the four-fifths" (bk. ii. ch. ii. § 4, last par.). The incidence of various taxes is discussed by Mill with Ricardian rigour (bk. v. chs. iii.-vi.); and other ordinary functions of government are considered as to their economical effects (chs. viii., ix.).

Of "optional" interferences grounded on erroneous theories (ch. x.), protection is first discussed in a splendid and candid section, in the course of which occurs the often quoted passage, in which protecting duties are said to be defensible "on mere principles of political economy, when they are imposed temporarily (especially in a young and rising nation), in hopes of nationalising a foreign industry, in itself perfectly suitable to the circumstances of the country." Another *locus classicus* in this chapter is the section on *combination*.

In the last chapter it is maintained that LAISSEZ-FAIRE is the general rule; but liable to large exceptions. Among these one of the most striking is the admission that upon certain assumptions the legal limitation of the hours of work might be advisable. A still more stringent governmental interference — transcending the proposals even of socialists—is put forward in a former chapter: to restrict the numbers of population by law (bk. ii. ch. xiii. § 2).

It will be understood that what has been attempted here is not to construct a table of contents magnified in a uniform proportion, but to select some leading topics and characteristic passages which may assist the student to comprehend Mill's system.

The *Political Economy* was revised in successive editions, but not much altered. Some of the changes in the second edition (1849) were favourable to socialism, one of the additions to the third edition (1852) is probably not an improvement, namely the sections 6-8 in the chapter on "International Values" (bk. iii. ch. xviii., cp. Bastable, *International Trade*, p. 29).

Some modifications of the doctrines stated in the *Political Economy* are to be found in Mill's later writings. In a review of Thornton in the *Fortnightly Review*, 1869, republished in the *Dissertations and Discussions* (vol. iv.), Mill recants the wage-fund theory. He did not, however, in his latest editions, withdraw the passages in chapter xi. of the second work. He seems to have regarded the correction as "not yet ripe for incorporation in a general treatise on political economy" (preface to eighth edition). In three posthumous articles on socialism published in the *Fortnightly Review*, 1879, Mill perhaps states the case against existing institutions more forcibly than in the *Political Economy*. However, he exposes the exaggerations of socialists with respect to the remuneration of capital and business power. He looks, not for a total renovation of society, but for such a modification of the idea of property as will make the institution work better than at present.

The rest of the acts and writings of J. S. Mill should occupy much space in a complete biography. But for the present purpose they need only be briefly referred so far as they contain applications and completions of his economic doctrines. In his *Liberty*, he continues the discussion of the limits of governmental interference, cp. *Pol. Econ.*, bk. v. In his *Subjection of Women* (1869), he advocates a cause in favour of which he had already stated what may be called the economic arguments (*Pol. Econ.*, bk. ii. ch. xiii. § 2, ch. xiv. § 5). The appropriation by the state of the "unearned increment" of land was agitated by Mill in papers and speeches which are collected in the fourth volume of the *Dissertations and Discussions*. With respect to this proposal it is forcibly urged by Thorold Rogers that "if, more than twenty years ago, Mr. Mill's scheme had passed into the region of practical politics, the purchase [of the land by the state] would have been disastrous . . . to the people of the United Kingdom" (*Economic Interpretation of History*, p. 515). The creation of a peasant proprietary, which Mill had proposed so far back as 1846 in the *Morning Chronicle* (see *Autobiography*, p. 235, and *Pol. Econ.*, appendix to vol. i.) was advocated in his pamphlet on *England and Ireland* (1868). Many of the causes which have been mentioned were promoted by Mill during his parliamentary career (1866-68). Among the measures which he advocated in parliament, the proposal to create a municipal government for the metropolis and to pay off the national debt are also of economic interest.

It would be impossible here to enumerate all the points at which Mill brought economic theory to bear upon practical politics. Like Adam Smith, he "associates the principles with their applications" (preface to first edition of *Pol. Econ.*). He treats political economy "not as a thing by itself, but as a fragment of a greater whole" . . . "for practical purposes inseparably intertwined with many other branches of social philosophy." The breadth of view required for this wider treatment of the science was obtained by his pre-eminence in general philosophy. In this respect also he, and he alone, is comparable to Adam Smith.

Among the circumstances which influenced Mill's intellectual life, must be mentioned his connexion with the India Office; where he was constantly occupied for thirty-five years, down to 1858, when the government of India was transferred to the crown. He himself has attributed a salutary influence to this official work. He has also acknowledged a large debt of inspiration to his wife, formerly Mrs. Taylor, whom he married in 1851. He ascribes to her, not the abstract parts of his political economy, but some of the socialistic elements; in particular, the chapter in the fourth book on the futurity of the labouring classes. Her influence did not cease with her death (1858). "I bought a cottage as close as possible to the place where she is buried, and there her daughter . . . and I live constantly during a great part of the year. My objects in life are solely those which were hers; my pursuits and occupations those in which she shared or sympathised."—*Autobiography*. Thus cherishing her memory as a religion, Mill lived at Avignon up to the year 1873, when he succumbed to a local endemic disease.

[The chief original source of information as to the facts and feelings of Mill's life is his *Autobiography*. It is supplemented by Prof. Bain's *J. S. Mill*. See also *John Stuart Mill*, by W. L. Courtney. Among the few works, or parts of works, which are directed systematically to the criticism of Mill's *Political Economy* may be mentioned: Marshall's *Princ. of Econ.* 5th ed. passages relating to Mill, in particular App. J. (2nd ed. note to bk. vi. ch. ii.); also article in *Fortnightly Review*, "On Mr. Mill's Theory of Value," 1876. —E. Cannan's *History of the Theories of Production and Distribution*.—J. Bonar, *Philosophy and Political Economy*, chapter on J. S. Mill.—Nicholson, *Principles of Political Economy*.—F. A. Lange, *Mills Ansichten über die soziale Frage*, etc., Duisburg, 1865.—Prof. J. Laughlin has published an abridged and annotated edition of Mill's *Political Economy*.] F. Y. E.

MILLAR, JOHN (1735-1801), historian, was called to the Scotch bar in 1760, and in the following year accepted the appointment of professor of law in the university of Glasgow, which post he held till his death. His lectures, which were extempore, attracted many students. In politics, Millar was an advanced whig, although opposed to universal suffrage. He strongly sympathised with the American colonists, and regarded the success of Pitt in 1784 as a fatal blow to the English constitution; even the excesses of the French revolution did not cause him to agree with Burke. Millar wrote *An historical view of the English Government, etc.*, London, 1787, 4to, 3rd ed., 1803, 8vo, 4 vols., which was designed as a counterblast to Hume. Only two volumes of the work were published in Millar's lifetime, and the last consists of essays which were intended to be worked up into the narrative. Those on the advances of manufacture and commerce, and the effect of that advance upon the morals of the people, are still of interest. Following Adam SMITH (*q.v.*), Millar recognises that "mercantile people are the best judges of their own interests." Millar's other work, *On the Origin of the distinction of Ranks*, London, 1771, 4to, 4th ed., Edinburgh, 1806, 8vo, containing a study of primitive society, is remarkable for its anticipation of the views of more recent writers. The prescience of his views on gynæcocracy, or that stage of social development wherein, through kinship counting from the mother, the position of woman is most important, is borne witness to by J. F. Maclennan, in his *Studies in Ancient History*, London, 1876, 8vo, p. 420. Millar is still under the sway of 18th century notions, such as that of the "simplicity" of savage races, and he wrote before the dawn, as it were, of the new science of anthropology. That, under these circumstances, he should have accomplished what he did, is much to his credit. It should be added that he was the valued friend of Adam Smith and David Hume.

[Memoir by John Craig prefixed to 1806 ed. of *Origin*, etc. as above. *Dictionary of National Biography*, vol. xxxvii.] H. E. E.

MILLES, THOMAS (between about 1550 and 1630), Customer[1] of Sandwich, was the author, among other works, of the following:

The Customers Replie, or Second Apologie. That is to say, An Aunswer to a confused Treatise of Publicke Commerce, printed and dispersed at Midlebourghe and London, in favour of the private Society of Merchants-Adventurers. By a more serious Discourse of Exchange in Merchandise, and Merchandising Exchange. Written for understanding Readers onely, in favour of all loyall Merchants, and for the advancing of Traffick in England, London, 1604, 4to. A note by the author shows to what decision he had arrived: "That Merchandising Exchange is that Laborinth of Errors & private Practise, whereby (though Kings weare Crownes & seem absolutely to raigne) particuler Bankers, private Societies of Merchants, & covetous persons (whose End is Private gayne) are able to suspend their Counsailes & controle their Pollicies . . . thus making Kings to be Subiects, and Vassalles to be Kings" . . . —therefore it is in the interest of Kings themselves to "relieve & maintaine . . . free-borne Traffick . . . and English Traffick."—*The Customers Apologie, the body whereof is to be read more at large in the Thesaurario Bodleyano Oxonii, and heere only abridged, paraphrased, and fitted into the written Table or Epitome of all his other Workes, touching trafficke and customers*, n.d. or place of publication, with manuscript notes.—*An Abstract, almost verbatim (with some necessarie Additions) of the Customer's Apologie, written eighteen yeares ago, to shew their distresses in the Out-Ports, as well through want of Maintenance and Meanes to beare out their Service; as Countenance and Credit in regard of others.*—A third abridgment, n.d., no title-page.—*The Customers Alphabet and Primer, conteining Their Creede or Beliefe in the true Doctrine of Christian Religion, Their Ten Commandementes*, etc., etc., 1608.—*An Out-Port-Customers Accompt, of all his Receipts*, . . . n.d.

[*Dict. Nat. Biog.*, art. "Milles, Thomas."] E. D.

MILLONES Y CIENTOS, duties levied in Castile on the consumption of meat, oil, wine, vinegar, ice, sugar, dried grapes, and tallow candles; first granted temporarily by the *Cortes*, they came to be continued every six years, and lasted to last century. Their operation was very vexatious and so irregular that, according to a memorial presented in 1646 by Alcazar de Arriaza, a pound of meat, which was sold at that time for 22 *maravedis* in Aranjuez, cost 46 in Ocaña, a few miles off.

[Canga Argüelles, *Diccionario de Hacienda* (London, 1826).—Colmeiro, *Historia de la Economía Política en España*, vol. ii. pp. 542 and 550.] E. CA.

MILNE, JOSHUA (1776-1851), was appointed actuary to the Sun Life Assurance Society in 1810.

He published, in 1815, *A Treatise on the valuation of Annuities and Assurances on Lives and Survivorships*, London, 1815, 8vo. The Carlisle Table contained in this work, which was founded on the published observations and private correspondence of Dr. HEYSHAM of Carlisle, started a new era in life assurance. Though its results were slightly more favourable, the Carlisle Table does not differ greatly from the English Tables, which are based on the observation of thirty years, and on materials drawn from the whole of England. *The Life of Dr. Heysham*, by Dr. Lonsdale, London, 1870, contains Milne's correspondence on the subject. Milne wrote the articles in the *Encyclopædia Britannica*, 4th ed., on "Annuities," "Bills of Mortality," and "Law of Mortality"; the last of which was reprinted as Appendix G. 3 of *Report*

[1] The receiver of Customs duties. Dowell, *Hist. of Taxation and Taxes in Eng.*, 2nd. ed., vol. i. p. 171.

from the Select Committee of the House of Commons on the Laws respecting Friendly Societies, 1827. He also gave evidence before this committee. He is quoted by Malthus in the latter's art. on Population, *Encyc. Brit.* (1824) see Bonar's *Malthus*, 1885, p. 72.

[*Dictionary of National Biography*, vol. xxxviii. p. 8.] H. E. E.

MILNER, James (d. 1721), merchant of London, contributed articles on trade between England and Portugal to the *British Merchant*, during the controversy on the 8th and 9th clauses of the Treaty of Utrecht (1713), (see King, Charles). He also published *Three Letters to the South Sea Company and the Bank*, etc. London, 1720, 8vo.

[For further notice of Milner's life see *Dictionary of National Biography.*] W. A. S. H.

MILREIS (Portuguese). The money of account in Portugal is the reis. Gold is the standard of value, the milreis, or 1000 reis, being the smallest coin of that metal. The larger gold coins, pieces of 2000, 5000, and 10,000 reis, are proportionate to the milreis in weight, and identical in fineness. The milreis weighs 27·37 grains, is composed of gold of the millesimal fineness of 916⅔, and is equivalent in sterling to 4s. 5½d., and in gold francs, 900 fine, to 5·6 francs. F. E. A.

MINE, COST BOOK PRINCIPLE. See Cost Book.

MINES. Down to the year 1688 all mines in England yielding gold or silver belonged to the crown. It was a common practice for the kings of the 14th and 15th centuries to grant charters to adventurers to enter upon private lands to search for mines. These included lead, tin, and copper mines, each of which contained silver or gold in small quantities, for the doctrine, as affirmed by the court of exchequer chamber in 1568, was that "be the quantity of it ever so small, yet the king shall have the whole of the base metal." The rights of the lords of the soil were so far respected that the mining charters contained clauses forbidding mining under houses or castles, sometimes also under arable lands and meadows, without their licence. A double royalty was imposed, one to be paid to the king, a second, somewhat less in amount, to the landlords. A lease of copper mines by Edward IV. reserves a royalty of one-eighth to the king and one-ninth to the lords of the soil; a lease of lead mines by the same king reserves one-sixteenth to the landlords and one-twelfth to the king. Pursuant to the general commercial and industrial policy of the middle ages, the inhabitants of mining districts in England were incorporated in district bodies invested with exceptional rights. The most notable instance of these corporations is that of the Stannaries or tin mines of Devon and Cornwall (Stannaries). Analogous powers were given to the mining law court of the foresters of Dean, which passed rules for the working of the mines and provided for the settlement of disputes among those enfranchised of the forest. The lead miners of Derbyshire in the same way enjoyed the right of a great Court Barmoot. In these exceptional districts the crown retains those paramount rights which were once probably universal, and the customs have been defined by modern acts of parliament (14 & 15 Vict. c. 94. High Peak, 15 & 16 Vict. c. 163. Low Peak, 1 Vict. c. 43; 24 & 25 Vict. c. 40; 34 & 35 Vict. c. 85, Forest of Dean, etc.). Miners under royal charters were also commonly free from being impleaded in the king's courts saving for life, limb, or land. They enjoyed the rights of chartered towns, being quit of tolls and tallages.

In 1568 an attempt was made to confine the rights of the crown to mines worked for the precious metals, and to exclude them from those mines in which the precious metals were a secondary incident. But the ancient principle was reaffirmed, three justices dissenting. In 1688 a momentous revolution was effected by parliament. By 1 Will. & M., c. 30, it was enacted that "noe mine of copper, tin, iron, or lead shall hereafter be adjudged, reputed, or taken to be a Royall Mine although gold or silver may be extracted out of the same." By this clause an immense property was transferred from the nation to the landowners. By an act of 1693 (5 Will. & M., c. 6) a modification was introduced in favour of the crown. While the subject may under this act work his base metals at will, the crown has the right of pre-emption of the ore at such prices as would represent its fair value in the absence of royal metals. Those prices were fixed by the act, and having now become obsolete, the crown's rights are not, in fact, exercised. But the royal prerogative, in the case of a mine worked for gold, was affirmed by the court of appeal in 1891 in the case of the Att. Gen. *v.* Morgan. Alum mines were occasionally claimed by the crown, and in the reign of James I. all the judges held that the crown could grant licenses for working saltpetre for gunpowder in any lands of the subject, for the defence of the realm, though the owners of the land were also left at liberty to mine upon their own account.

Owing to the scarcity of the precious metals felt towards the close of the middle ages, constant efforts were made by the English kings themselves to discover them in this country. The science of mining being very imperfect, foreigners were frequently brought in from abroad, as appears from the mining patents granted by Edward IV. and Henry VIII. Wolsey took a particular interest in the development of mining industry. Under Edward VI. endeavours were made to discover and work mines in Ireland, but these proved a failure. Metallurgy was sc

little understood that under Mary a commission was appointed to learn the art of refining from a German adventurer. In the time of Elizabeth mining engineers were still largely German. The rights of the crown naturally checked mining enterprise until the act of 1693, from which it received a great impetus.

Coal mining was practised in the north of England and the south of Scotland from very early times, and the leasehold system with royalties was common in the 14th century. A frequent practice with corporations was to limit the quantity of coal to be worked per diem in order, doubtless, to prevent exhaustion of the supply, it being a prevalent opinion that the coal mines could only be worked near the surface. In 1610 Sir George Selby informed parliament that twenty-one years would exhaust those of Newcastle. This stimulated invention for draining mines in order to work the lower levels, from which developed the whole art of modern coal mining.

Until the 19th century, except in the case of royal mines, there may be said to have existed no general statutory regulations for the working, management, and inspection of mines, nor for the security of those employed. By 5 & 6 Vict. it was forbidden to employ females underground after 1st March 1843. The employment of boys under ten was also forbidden. The inspection of coal mines by government was undertaken in 1850 by 13 & 14 Vict. c. 100, which empowered the appointment of inspectors. Analogous provisions were enacted for metalliferous mines in 1872 (35 & 36 Vict. c. 77). This act raised the age for the employment of boys to twelve, after the example of the Mines' Regulation Act of 1860 (23 & 24 Vict. c. 151). There is a natural parallelism in the legislation affecting the two classes of mines, that for coal mines being distinguished by the special precautions ordered by the legislature with the object of preventing explosions, etc. Common features are the prohibition of the payment of wages in public-houses; notice to inspectors in case of explosions, accidents, and loss of life; rules as to the opening and working of new shafts; and codes of offences in the nature of contravention of the rules for the safe working of the mines approved by the secretary of state. The principal acts now in force are, for coal mines that of 1887 (50 & 51 Vict. c. 58), that of 1908 (the Eight Hours Act), and for metalliferous mines that of 1872 (35 & 36 Vict. c. 77), and that of 1875.

MINES AND MINERALS, EXHAUSTION OF. While this circumstance sometimes brings about the impoverishment of the district where it occurs, the following causes make it difficult to obtain precise information on the subject—(1) more careful search, better means of communication, and improved methods of working have tended to increase the supply from districts which were becoming exhausted: (2) the general growth of population masks the effects of a local decline, and the latter may be prevented, where mines are failing, by the development of other industries. This sometimes is exemplified in the mines. Dolcoath, by deepening the workings, was transformed from a copper mine to one producing tin. The great open working at Carclaze, though its tin is now almost valueless, is continued for china clay. (3) Mines and quarries in ancient times were frequently worked by slave or convict labour, an example followed more recently by Spain in America and by Russia in Asia. A settlement of this type adds little to the prosperity of the immediate neighbourhood, and the effects of its disappearance are comparatively unimportant. (4) In districts where labour is free, the settlements at first are hardly more than camps; log-huts or shanties being the nearest approach to permanent buildings. In case of a speedy failure, the horde disperses like birds of prey from a consumed carcase, and leaves hardly more trace of its presence. (5) If, however, the undertaking is prosperous, the camp is gradually changed into a city; and the instances of this are at present so young that, as yet, they are in the full tide of success. In these cases the effects of the exhaustion of the mineral wealth of a district are still in the future. The harvest is still being reaped; few fields have yet been absolutely cleared. Instances must mainly be sought in localities comparatively unimportant; but exhaustion is only a question of time, and such investigations as those of Jevons on *The Coal Question*[1] remind the economist of the necessary limitations of the nature of this part of our wealth.

Precious Metals.—Much might be said as to the effects produced on the more civilised part of the world by the arrest—from the decline of Rome till about the 9th century—of any serious efforts to obtain fresh supplies of gold

[1] "A little reflection will show that coal is almost the sole necessary basis of our material power . . . England's manufacturing and commercial greatness, at least, is at stake in this question, nor can we be sure that material decay may not involve us in moral and intellectual retrogression."—Jevons, *Coal Question*, Introd.

and silver,—commodities liable to considerable waste from wear and the purposes to which they are applied; but this is beside the question now considered. Moreover, if a want once seemed likely to occur, owing to the exhaustion of Spain and other *el dorados* of the old world, it has been more than remedied since the discovery of America by the constant opening up of new fields in that and other parts of the globe.

In remote parts of Egypt and the regions about the eastern Mediterranean, places may be found, now deserted, in which formerly the search for gold was actively prosecuted, but no instance is more striking than that of the *Ruined Cities of Mashonaland*, described by Mr. Bent. Here, at various localities between the Zambesi and the Limpopo, often almost buried by vegetation, ruins are found of fortified towns, the walls of which, built of granite blocks, are sometimes 12 to 15 feet thick. Their inhabitants evidently had settled among an unfriendly people to work the district for its gold—they disappeared perhaps as late as the 9th century, and a higher was replaced by a lower type of civilisation, if that term is applicable to the natives of Mashonaland. Again, for a time at least, Mexico supplied an object-lesson in the same kind. Here, during the civil wars from 1810 to 1824, many important silver mines were abandoned, the population dwindled, that of Potosi falling at this period from 130,000 to 9000, and the indirect loss even to agriculturalists was very great. Similar effects have been noted in Columbia, Chili, and Peru from like causes. The Laurium mines, till lately, afforded another example; worked in classic times they were afterwards abandoned, and ruins marked the sites of places once flourishing. Since 1870 they have been re-opened, and even the old slags are being smelted over again. America and Australia have afforded instances of the mushroom growth of settlements, followed by no less rapid desertion. In 1857 there was a rush to the Frazer river (Columbia), followed in 1863 by an exodus of from 15,000 to 20,000 people to Nevada.

Other Metals.—Copper mines were worked in the Sinaitic peninsula about Sarabit-el-Khadim by the ancient Egyptians, where ruins and tablets indicate the presence of a considerable colony; now the region is deserted. Many ruined buildings in Cornwall mark the sites of mines, especially of tin, exhausted or disused.

The following tabular statement, drawn up from the census reports of 1881 and 1891, will show how seriously the population of some of the parishes in the mining districts of Cornwall has been affected, the decline in one case amounting roughly to 25 per cent; the larger towns, as might be expected, having suffered least. In 1901 there was no great alteration owing to the growth of other industries.

Parish.	1881.	1891.
Breage	3017	2751
Callington	1925	1888
Helston	3432	3198
Kea	2470	2103
Liskeard	4053	3984
St. Agnes	4630	4249
St. Cleer	2865	2124
St. Ives	6445	6094
St. Just	6409	6119
Wendron	4584	4250

The same may be said of other spots in Derbyshire, Devonshire, Wales, etc., though the population as a whole has increased.

The Weald of Sussex was once the seat of important iron-works; the last furnace, at Ashburnham, was extinguished in 1828 (Woodward, *Geology of England and Wales*, pp. 357, 361). The woods often conceal abandoned mines and heaps of slag.

Coal, petroleum, etc.—In Britain the mines of coal, often with associated ironstone, in parts of Staffordshire and Shropshire are beginning to show signs of exhaustion, with the same result. But these industries are so modern, comparatively speaking, that probably almost a century must elapse before marked effects are produced. In various parts of the United States, particular localities have become thronged and prosperous by the discovery of mineral oil, and have been deserted owing to its unexpected exhaustion, but the causes already named have restricted the area affected and prevented any remarkable consequences.

Ornamental minerals and rocks.—The turquoise mines of Sinai, like those of copper, were once busy and are now deserted. In the days of the Pharaohs and under the dominion of Rome, the quarries of Egypt were in full activity. Those for granite and the neighbouring ruins near the first cataract have been often described. Yet more striking are those at Jebel Dokhan, from which the red porphyry, so largely exported to Italy, was obtained. These lie at a height of 3650 feet above high water mark, nearly 100 miles from the Nile and on the eastern side of the watershed between it and the Red Sea. The remains of several Roman stations are passed on the route from Kuneh. From the chief quarry a road "led down to an ancient town with workshops." Hence a path went to an old town in the valley, and beyond are the ruins of a Roman temple. In fact deserted quarries are not rare in the mountainous country between the Nile and the Red Sea (*Brit. Assoc. Rep.*, 1887, p. 802). From Algeria and Tunis marbles were exported in large quantities by the Romans; the quarries were deserted, the district was sparsely inhabited, till a few years since, when some of them were again opened (*Brit. Assoc. Rep.*, 1885, p. 1028). The white marble of Thasos was in great request in the age of Hadrian, and

was worked at much earlier dates. The remains of a quay constructed round the headland, the tombs and other ruins of a town and two villages at least, "all in former days thriving on the quarrying and export of marble," indicate the "former position of a commercial centre, dating for centuries before the Christian era, and leaving traces of having continued in prosperity down well into the period of the eastern empire" (*Brit. Assoc. Rep.*, 1887, p. 200). We cannot, owing to the circumstances already mentioned, point to any striking instance of a country ruined by the exhaustion of its mineral wealth, but notwithstanding this the lesson is plain. The mineral store of each district and of the whole earth is practically limited in quantity, be it gold, or any other metal, be it coal or any fuel. The formation of a fresh supply is a process so slow that, for all practical purposes, it may be excluded from consideration. The waste also of the precious minerals is considerable; the wear and tear of the more homely is large; the destruction of combustibles is complete. Hence the store, sooner or later, must be exhausted, now in this country, now in that. In agriculture, provided manures can be obtained, the land seems never to lose its productive power; the mine or quarry, once worked out, has played its part for good in the economy of the earth, and the ill which it has done "lives after it." Metallurgical processes are attended with drawbacks even at the time, but though, when the minerals are no longer obtained, noxious fumes are no more emitted to devastate the neighbourhood, the waste heaps of rubbish or slag still remain, whereon no useful herb can grow and only a forest can spring up after long years. In some districts also the general ruin of the surface, the choked beds of rivers, and large tracts of fertile meadows buried beneath barren gravels, are the heritage bequeathed by the miner. The decline and fall of the nation whose prosperity has depended solely on its mineral wealth, will be not less appalling than that of imperial Rome. T. G. B.

MINING ROYALTIES. See ROYALTIES.

MINGHETTI, MARCO (1818-1886). A statistician and political economist born at Bologna. In 1848, when Pope Pius IX. appeared to espouse Italian nationality, Minghetti became a member of the pontifical council of state, and minister in the first liberal secular ministry of Pius IX. But when the pope set himself against the war of independence, Minghetti resigned office and joined the camp of Charles Albert. He fought at Custozza and Goito, and later on was a colleague of Count Cavour at the Paris congress of 1857. He then became, under Cavour, general secretary of foreign affairs, secretary of the interior in 1859, minister of the interior in 1860, and ambassador. After having greatly assisted in the formation of united Italy, he became president of the council of the kingdom in 1863, and again from 1873 to 1876. An able financier, he applied himself primarily during his ministry to restore Italian finance, and when he left office the budget was balanced.

Minghetti was an eloquent and incisive speaker, a man of the broadest culture, a man of letters, and an historian. He is well known by economists for several works, but chiefly for his book on the relation between economics, ethics, and justice. In this work, ably and clearly written, moderate in opinion, and giving evidence of sound culture, Minghetti based economic science on ethics and law, anticipating, to a certain extent, the modifications which were afterwards applied to the English classical school—placing himself on an intermediate ground between this school and the new theories, principally developed in Germany. While too moderate a man to ally himself with the "socialists of the chair," Minghetti attaches more importance to the phenomena of the distribution of wealth than to those of production, and this basis of his eventually formed one of the canons of the new doctrines. This order of ideas inspired various social laws of which he became a promoter, for example, the law on children's labour, on emigration, on pensions, etc.

Originality and depth of research are perhaps wanting in the writings of Minghetti on economics, but on subjects more his own he was one of the most far-seeing and deep thinkers, and one of the purest and most elegant writers of modern Italy.

MINIMUM (Rate of Discount). The rate known as the "bank rate" is settled every Thursday at the weekly meeting of the bank directors, and published when the meeting is over. It was formerly the minimum rate current not only in the bank discount office, but in the market generally. This lasted as long as the resources of the Bank of England formed the greater part of the capital in the money market, or even later, whilst the bank remained the largest single influence therein. But now, although the deposits of the bank have increased, those in the hands of the other banks have grown in far greater proportion, and the competitive effect of this outside capital is increased by the fact that it is mostly in the hands of a small group of large and powerful banks, instead of being wielded by a large number of banks each individually small. The result of this change has been to bring the rate of discount in the open market, for long periods together, often much below the bank rate; the

bank directors being supposed, in fixing their rate, to have regard not only to the amount of capital they have to employ, but also to the state of the circulation and the condition of the foreign exchanges. On the other hand, it has been strenuously contended by the late Mr. Thomson Hankey, and some other prominent directors of the bank, that the bank's policy should be governed by the ordinary considerations relating to their banking business only.

As a fact the directors have never reduced the official rate below 2 per cent, notwithstanding that in recent years the open market has frequently stood for months together at, or about, 1 per cent. It is understood that the bank minimum now only regulates its relations with the outside market, and that its own customers obtain accommodation at the rates charged by other banks. The bank rate still governs, at a distance, rates charged or allowed in some cases upon advances or deposits. R. W. B.

MINIMUM OF SUBSISTENCE, THE. The doctrine that the labourer cannot permanently earn more than the minimum of subsistence, that is, enough to keep him and his wife and children alive, has often been ascribed to political economists as a body. It has been used to prove at one time the inutility of any attempt to raise wages, and at another time the injustice of the existing order of society. This doctrine, however, has not been universally taught by political economists, and is not borne out by facts. It is connected with the doctrine of the wage fund, and the mode in which it has grown up will best appear from a brief survey of the course of speculation on the subject of wages.

For this purpose we need not go back further than the French *Économistes* of the 18th century. TURGOT (*e.g.*) declared that the labourer could not in the long run gain more than a bare subsistence, probably basing this assertion on the experience of his own time and country. The bulk of the labouring population of France had been reduced by fiscal and social abuses to a bare subsistence—sometimes even to less, seeing that many died of hunger in bad seasons. In Great Britain at the same time the condition of the labouring class was incomparably better. We find accordingly that Adam SMITH does not agree with Turgot on this point (cp. Rae, *Life of Adam Smith*, pp. 220-222). "There are certain circumstances," he writes, "which sometimes give the labourers an advantage, and enable them to raise their wages considerably above this rate," namely, "the lowest which is consistent with common humanity" (*Wealth of Nations*, bk. i. ch. viii.). He then proceeds to inquire what circumstances have this beneficial effect. He concludes that "the liberal reward of labour, as it is the necessary effect, so it is the natural symptom of increasing national wealth. The scanty maintenance of the labouring poor, on the other hand, is the natural symptom that things are at a stand, and their starving condition that they are going fast backwards" (*ib.*).

The next economists to be considered with reference to the minimum of subsistence are MALTHUS and RICARDO. "Malthus," Dr. Bonar says, "without knowing it, was certainly the father of the theory of a wages fund" (Bonar, *Malthus and his Work*, ed. 1885, p. 270). He was deeply impressed with the poverty resulting from an unlimited increase of population, and he seems to have thought that only prudential self-restraint could raise the labourer's income above the minimum that could keep him alive. Ricardo expressed himself on this subject in a way which seems at first sight to coincide with Turgot's assertion. "The natural price of labour is that price which is necessary to enable the labourers one with another to subsist and to perpetuate their race without either increase or diminution" (Ricardo, *Principles of Political Economy*, ch. v.). But he qualifies this proposition by others which have been too commonly disregarded. "It is not to be understood that the natural price of labour estimated even in food and necessaries is absolutely fixed and constant. It varies at different times in the same country and very materially differs in different countries. It essentially depends on the habits and customs of the people." He adds—"The friends of humanity cannot but wish that in all countries the labouring classes should have a taste for comforts and enjoyments, and that they should be stimulated by all legal means in their exertions to procure them." Ricardo thought that real wages might increase with the increase of capital, but he thought that after the period at which all fertile land had been taken up, real wages would tend to fall. Thenceforward rent would grow at the expense of wages and of profits. Some of his expressions would suggest also that the only way in which the labourers could permanently improve their condition was by restricting their number. Whoever may have originated the doctrine of the wages fund, J. S. MILL was the first to formulate it clearly and precisely. From his conception of the WAGES FUND it followed that the labourers' wages must sink to the minimum of subsistence unless the number of labourers were severely kept down. Mill therefore denounced large families with extraordinary violence. Although he afterwards admitted the incorrectness of his views respecting the wages fund, he never completely recast his theory of wages. LASSALLE and later socialist writers eagerly adopted the conceptions of a fixed wages fund and a minimum of subsistence for the labourer as helpful in proving that under the existing order of society the labourer

must always be miserable, and that therefore the existing order of society is inhuman. For similar reasons these conceptions have been employed by Mr. George and by others who wish to abolish private property in land. But, since Mill and Lassalle wrote, the whole subject of wages has been reconsidered in the light of experience, and the doctrine of the minimum of subsistence has been seriously shaken. It has been found that countries in which wages are high can compete successfully with countries in which wages are low, and that real wages may be raised without labour becoming really more costly. The explanation of those facts is twofold. In the first place the wages which just keep a man alive are not enough to keep him efficient. It is a true economy to pay the labourer such wages as will maintain him in full vigour of mind and body. In the second place ill-paid labour is wasteful and dear; it is labour uneconomical to employ. Every rise of wages stimulates the employer to improve his methods of organisation and his mechanical contrivances. Thus it is that within certain limits to be determined only by experience the rise of wages does not necessarily involve loss to the employer. If therefore the labourers are organised, they can apply pressure sufficient to keep wages much above the minimum of subsistence. Natural wages, if so objectionable a term is still to be used, should denote those wages which are really—not apparently—the most economical to pay.

Again the old theory of the wages fund must be modified. General Walker repudiates the wages-fund theory altogether. He holds that wages are paid out of the product of labour, and can be increased indefinitely so long as that product continues to increase (Walker, *Political Economy*, pt. v. ch. vi.). Another American economist, Mr. Gunton, goes further and says that wages are determined by the cost of production of labour, in other words, by the standard of living among the labourers. There is not space here to examine these recent theories. But the doctrine that the remuneration of the labourer tends to dwindle to the minimum on which he can support life may be considered obsolete.

MINIMUM WAGE. See Living Wage.

MINORAT is nowadays an institution peculiar to Germany and German Austria, according to which *Bauerngüter*, which may be defined as entailed peasant holdings, are inherited by the youngest male heir in the nearest degree of relationship; in former times it existed in French Brittany under the name of *Droit du Juveigneur*[1] (see Borough English). In contradistinction, entailed estates belonging to noble families descend, in Germany, by Majorat (*q.v.*), and even for *Bauerngüter*, the rule of *minorat* is far from being universally followed. Where it prevails it is considered that at the time of his father's death, the eldest children will probably be able to provide for themselves and be independent. But, under other aspects, *minorat* is subject to adverse criticism: there is often a long uncertainty before it is known who will be the heir of the holding, and the latter frequently is only placed in the way of being productive after the actual owner is already incapacitated by old age. Moreover, another unfavourable circumstance is that the heir is too often still a minor when the holding descends to him.

E. Ca.

MINT (Latin *Moneta*, a name of Juno, in whose temple money was coined in Rome, hence mint, coined money, Anglo-Saxon *mynet*). As the right to issue coin belongs, in modern societies, exclusively to the sovereign power (Hale, Coke, Blackstone), it follows that a Mint cannot legally issue the coins of the country in which it is situated except under the directions of the sovereign or other central authority. In Anglo-Saxon times a large number of mints were established throughout this country under the control of Moneyers,—officials responsible for the integrity of the coinage. Since the Norman conquest it appears to have been a common practice, even as recently as the 17th century, to establish a temporary Mint where the sovereign happened to reside, and it was not till after the great recoinage of silver at the end of that century (see under Sir Isaac Newton) that all coinage operations were concentrated, so far as England and Ireland are concerned, in the Tower of London. The Dublin Mint was closed in 1696. The Edinburgh Mint, first erected in 1574, was not finally abolished until 1815.

Early in the 19th century, in 1811, the Mint was removed from the inconvenient premises which it occupied in the Tower to the present site on Tower Hill, and in 1850 the complete control of all its operations passed into the hands of the government.

The primary duty of a Mint, namely the conversion of bullion into coin, naturally entails other duties connected with the precious metals.

[1] From *juvenior*, taken as comparative of *juvenis*.

Thus the hall-marking of plate, and the refining, melting, and casting of gold and silver into commercial bars, are undertaken by certain foreign Mints, but in this country the work of the Department may be grouped under the four following heads:

1. *The coinage of gold presented by private holders for that purpose.*

Under § 8 of the Coinage Act 1870 (33 Vict. c. 10), "any person" is entitled to bring gold bullion to the Mint and, subject to certain specified stipulations, "such bullion shall be assayed and coined, and delivered out to such person"—according to priority—"without any charge for such assay or coinage, or for waste in coinage." Any alloying metal required is also supplied without charge, and a provision of the Coinage Act 1816 (56 Geo. III. c. 68) is re-enacted to the effect that out of every twenty troy pounds weight of standard gold bullion there shall be produced 934 sovereigns and one half-sovereign. This corresponds to the troy ounce being valued at £3 : 17 : 10½ (see GUINEA, INTROD. AND RATING OF). Since the Bank Charter Act 1844 (7 & 8 Vict. c. 32), all persons are, under § 4, "entitled to demand, from the Issue Department of the Bank of England, notes in exchange for gold bullion at the rate of £3 : 17 : 9 per ounce of standard gold," subject to the metal being melted and assayed by persons approved by the bank at the expense of the owner. There is a difference of only 1½d. per ounce in the two rates, but the delay necessary for coinage operations leads holders of bullion to take advantage of the Bank Charter Act, and obtain payment at once. Thus it happens that, as concerns the gold currency, the Mint in this country deals almost exclusively with the Bank of England. Coins which are no longer legal tender, in consequence of their having been reduced in weight by wear below their least current weight, are received for recoinage through the same channel, and, under the Coinage Act 1891 (54 & 55 Vict. c. 72), are replaced at the expense of the State.

2. *The coinage and issue of token silver and bronze pieces as they are required, from bullion purchased on account of the Government.*

The arrangements in force for the issue and maintenance of subsidiary coins are essentially different in character, primarily in consequence of the fact that, whereas these are merely tokens and, therefore, only legal tender to a limited extent, gold coins are intrinsically worth their face-value and of unlimited legal tender.

In connection with the silver currency, however, it is interesting to note that § 9 of the Coinage Act 1816 directed that from a date to be fixed by royal proclamation "any person or persons, native or foreigner," might bring silver coin, plate, or bullion to be converted into coin at the rate of sixty-six shillings per troy pound, sixty-two shillings being returned to the importer and four retained by the Mint to meet the cost of assaying, loss, and coinage. No such proclamation was ever issued, and this section remained a dead letter therefore until the Act was repealed in 1870. Under the provisions of the Act passed in that year, whenever token coins are required to be struck, the requisite silver and bronze bullion is purchased in the market with sums advanced for the purpose out of the Consolidated Fund, and, on issuing this coin at its full nominal value, the Master of the Mint pays the proceeds into the exchequer under two heads:—(*a*) Repayments of advances for the purchase of bullion; and (*b*) SEIGNORAGE (*q.v.*), or, as now defined in practice, the excess of the circulating value of the coin above the purchase price of the metal used in its manufacture, *i.e.* profit.

Worn silver coin is received by the Mint at its nominal value, and all expenses connected with the supply of Imperial token coins to Colonies, and their renewal, are also borne by the Department.

3. *Execution of coinages required by British Colonies and Dependencies.*

Subject to the requirements of the Imperial currency being met, the Royal Mint undertakes the execution of any coinages required by Colonies at fixed charges which are calculated to cover the actual cost of the work performed. The requisite bullion having been delivered at the Mint by the colonial agent, is converted into coin and shipped to the colony at the expense of that colony, all profit in respect of seignorage of course falling into the colonial exchequer. If from any cause the Department is not in a position to undertake such a coinage, the work is usually performed, under government control, by a private firm in Birmingham.

4. *Manufacture of naval, military and other medals, and miscellaneous duties.*

The manufacture of medals forms an important subsidiary branch of the work of most Mints. In this country they are struck on behalf of the War Office, Admiralty, and India Office, and for the Sovereign's private issues, as well as for the Royal Society. Among other duties performed by the Mint are the manufacture of the Great and other official seals, both home and Colonial, and of plates and dies for printing, postage and other stamps, the verification of the standard of plate hall-marked at certain assay offices, independent examination of coin issued from Indian, and occasionally, certain foreign Mints, etc.

Branch Mints were established at Sydney, Melbourne, Perth, Ottawa, and Bombay by orders in council passed in 1853, 1869, 1898, 1907, and 1917. Immediately after the early discoveries of gold in Australia, the question of establishing local Mints for coining the precious metal, and thus facilitating its use in

commerce, was raised in several of the colonies. New South Wales was the first to obtain the necessary authority, but that in Victoria was not opened until 1872. When first issued the Sydney coins were not intended to circulate in the United Kingdom, but application was soon made by the colony for this concession to be granted, and in 1862 the question was considered by a select committee of the House of Commons. As a result of this committee's report, acts were passed in 1863 and 1866, under which Sydney coins were declared to be legal tender in the United Kingdom and in specified colonies. Similarly the coins to be struck at Melbourne were legalised in 1869. Since 1871 the coins of all branch Mints have been identical in design with those of the Royal Mint in London, distinguished only by the mint-marks S, M, P, C and I respectively. The current expenses of the branch Mints are met out of permanent annual appropriations made by the local legislatures, £15,000 at Sydney, £20,000 at Melbourne, £25,000 at Perth, and $200,000 at Ottawa, all revenue being paid into the local treasuries. Unlike the Royal Mint, they impose a coinage charge which amounted to 1 per cent, or nearly 9½d. per standard ounce, in 1855, but has for many years been reduced to 1½d. or less. Token silver and bronze coins of the Dominion have been struck at Ottawa since the branch Mint was first established there in 1907, and the Australian token currency is struck at the Melbourne branch, but the issue of Imperial silver and bronze is confined to the English Mint.

E. R.

MINT, UNITED STATES. The mint of the United States was established, under the act of 2nd April 1792, in Philadelphia. In 1873 its administration was made a bureau of the treasury department under a director. In 1835 branch mints were established at Charlotte, N.C., at Dahlonega, Ga., and New Orleans; in 1852 at San Francisco; in 1862 at Denver; in 1863 at Carson, Nev. Coinage, however, has been suspended at Denver, Charlotte, and Carson. According to the act of establishment, the unit of account was the DOLLAR divided into tenths or DIMES, hundredths or CENTS, and thousands or MILS. FOREIGN gold and silver coins passed current at certain established rates, until by act of 21st February 1857 they ceased to be legal tender. By the act of 1792 a gold dollar (see DOLLAR, UNITED STATES) was to contain 24·75 grains of pure gold, and the silver dollar (see DOLLAR, UNITED STATES) 371·25 grains of pure silver, the relative value of the two metals being 15 to 1. There was free coinage of both metals, and no charge save that in case of immediate payment in coin, a deduction of one-half per cent from the weight of the pure gold or silver was made. The gold coins authorised were the EAGLE $10 (= £2:1:1), the half eagle, and the quarter eagle. The fineness was 916⅔ parts gold per 1000 (11/12th fine). The silver coins authorised were the dollar, 416 grains in weight, the half dollar, quarter dime, and half dime—all being proportional parts of the dollar in weight, and in fineness 892·43 parts in the 1000. There was no change in the weight or fineness until, by the act of 28th June 1834, the relative value was changed to 1:16·002 by reducing the amount of pure gold in the dollar to 23·20 grains, and increasing the fineness of the coins to 0·899225. The act of 1837 raised the fineness to 0·900, the pure gold in the dollar to 23·22 grains, and changed the ratio to 1:15·988.

In 1837 the weight of the silver dollar was fixed at 412½ grains. The fineness of silver coins was also fixed at ·900. The next important change was by the act of 21st February 1853, when free coinage of silver pieces of less than one dollar in value were closed, the fractional parts of the dollar made subsidiary, and the weights reduced, the half dollar weighing 192 grains. The coinage of the double eagle $20 (£4 : 2 : 2½), and the one dollar, gold, was authorised 3rd March 1849, and the three dollar, gold, 21st February 1853. The coinage of the two latter was discontinued in 1890. In 1902 the gold Louisiana Exposition Dollar was struck. The coinage of a three cent piece was also provided for by act of 3rd March 1851. By act of 12th February 1873 the coinage of the silver dollar, half dime, and three cent piece was discontinued, and the weight of the subsidiary coin slightly raised, that of the half dollar to 192·9 grains.

The act of 28th February 1878 (BLAND ACT) restored the coinage of the standard silver dollar, though not free, and provided for the purchase at the market price by the government of silver bullion at from $2,000,000 (say £400,000) to $4,000,000 (say £800,000) per month, and its coinage. This policy was again changed by the act of 14th July 1890, which authorised the monthly purchase of 4,500,000 ounces of silver, or so much thereof as might be offered at the market price, not exceeding $1·00 for 371¼ grains of pure silver, and the issue in payment of treasury notes redeemable on demand in coin. It was also provided that so much silver should

be coined as might be necessary to redeem the treasury notes issued in payment for the silver. In accordance with this a limited amount was coined until 1893, when the act of 1st November repealed the purchasing clause. The gold standard was adopted in 1900.

By the act of 12th February 1873, individuals had the right to deposit silver bullion for coinage into trade dollars (see DOLLAR, TRADE); this was discontinued 3rd March 1887. For a brief period a twenty cent silver piece was struck; in 1892, 5,000,000 silver half dollars, known as Columbian half dollars, were struck, and also 40,000 quarters; and in 1899, 50,000 Lafayette souvenir dollars.

By the act of 2nd April 1792 the coinage of a copper one cent and a half cent, of 264 and 132 grains respectively, was authorised. The weight of the cent was afterwards reduced to 208, and then to 168 grains. Copper coinage was discontinued in 1857, and in its place was minted a nickel one cent coin, 72 grains in weight, and consisting of 88 per cent copper and 12 per cent nickel. A further change in this coin was made, 22nd April 1864, by reducing the weight to 48 grains, and changing the composition to 95 per cent copper and 5 per cent tin and zinc. A two cent piece was also authorised, discontinued in 1873. Between 1865 and 1890 a three cent piece was authorised; and 16th March 1866 a five cent coin, popularly known as a nickel, 75 per cent copper and 25 per cent nickel, was authorised.

The total coinage of all the mints until 30th June 1909 has been as follows:—

Gold.		
Double eagles, 1850-1909	$2,252,801,140	£450,560,228
Eagles, 1793-1804, 1838-1909	451,341,670	90,268,334
Half eagles, 1793-1909	350,113,685	70,022,737
Three dollars, 1854-89	1,619,376	323,875
Quarter eagles, 1796-1808; 1821-1909	34,928,645	6,985,729
Dollars, 1849-89	19,809,337	3,961,868
Silver.		
Trade dollars, 1873-87	35,065,924	7,193,185
Dollars, 1793-1805; 1836-73; 1878-1909	578,353,848	115,670,769
Half dollars, 1793-1909	185,234,355	37,046,871
Quarter dollars, 1793-1909	96,029,473	19,205,895
Twenty cents, 1875-78	271,000	54,000
Dimes, 1793-1909	59,685,748	11,937,150
Half dimes, 1793-1805; 1829-73	4,880,219	976,044
Three cents, 1851-1873	1,282,087	256,417
Minor Coinage.		
Five cents, 1866-1909	31,272,413	6,254,422
Three cents, 1865-90	941,350	188,270
Two cents, 1864-73	912,020	182,404
Cents, 1793-1909	21,509,944	4,301,989
Half cents, 1793-1909	39,926	7,985
Total—Gold	$3,110,613,853	£622,122,771
Silver	961,702,654	192,340,531
Minor	54,675,653	10,935,130
Grand Total	$4,126,992,160	£825,398,432

As indicated by foregoing statements, there has been a large seignorage on silver coinage, and up to 1910 there had been paid into the treasury of the United States on this account $159,935,840 (£31,987,168).

From the standpoint of administrative finance, the bureau of the mint is an important office. In the fiscal year ending 30th June 1910 the expenditures were $1,427,270 (£285,454), of which $225,827 (£45,165) was for salaries and $937,891 (£187,578) for wages. The income was $4,869,672 (£973,934), of which $242,250 (£48,450) was from charges for parting and refining bullion, and the larger part of the remainder from seignorage. In 1873 the charge for making gold coins was reduced to one-fifth of one per cent, and in 1875 entirely abolished, save that the depositor pays for the copper used in alloying the gold.

The legal limit of tolerance in fineness of gold coins is 0·001, and of silver coins 0·003. Each year there is an annual trial of coins by an independent commission appointed by the president.

[See the *Annual Reports of the Director of the Mint*, especially the *Twenty-first*, for 1893, pp. 83-94. See also H. R. Linderman, *Money and Legal Tender*, New York, 1879.—W. A. Shaw, *The History of Currency*, pp. 246-266.]

D. R. D.

MINT PAR OF EXCHANGE. The equivalent, in terms of one coinage, of the quantity of pure metal contained in another standard coin, both being of the same metal, and taken at mintage weights. The sovereign contains 113·001597 grains or 7·322379 grammes of fine gold, and the following are its equivalents in the coins of other gold-standard countries. The value in pence of the unit of each country is also given:—

		£1 =		
France, and Latin Union	fcs.	25·221	franc	= 9·515d.
Denmark and Scandinavian Union	kr.	18·159	krone	= 13·216d.
Germany	mks.	20·429	mark	= 11·754d.
Holland	fl.	12·107	florin	= 19·823d.
Austria	kr.	24·017	krone	= 9·992d.
Portugal	mil.	4·504	milreis	= 53·284d.
Brazil	mil.	8·912	milreis	= 26·929d.
United States	$	4·867	dollar	= 49·316d.
Argentina	$	5·044	peso	= 47·576d.
Uruguay	$	4·707	peso	= 50·988d.
Chili	$	13·346	peso	= 17·995d.
Russia	rb.	9·458	rouble	= 25·375d.
Japan	yen	9·763	yen	= 24·577d.

The par given above for France serves also for the other countries of the Latin Union—Belgium, Switzerland, Italy, and Greece; francs being altered for Italy into *lire*, and for Greece into *drachmas*. It serves also for Spain with francs altered into *pesetas*, though quotations are usually made in pence per dollar, or piastre, of five pesetas. The par given for Denmark serves also for Sweden and Norway.

Mint pars are given above for Portugal, Brazil, Argentina, and Chili, although at present (1906) their actual exchanges are in terms of more or less inconvertible paper money.

R. W. B.

MINT PRICE OF BULLION. With free and open mints that which is frequently called the mint price is the equivalent in terms of coin. By the Coinage Act (33 Vict. c. 10, § 8), any person may bring gold bullion to the mint, and receive the same again, assayed and coined, without charge, provided the bullion be of such character as not to require refining. The sovereign weighs 123·27447 grains of standard gold, *i.e.* $\frac{11}{12}$ fine, and, therefore, for every ounce of gold bullion of equal fineness that is brought in, the importer will receive back in coin, $£\frac{480}{123\cdot27447} = 3\cdot89375$ or £3 : 17 : 10½. The importer will of course have to wait his turn, and also whilst his parcel of gold is being coined; and, in order to avoid this, one of the conditions imposed in the charter of the Bank of England is that it shall always purchase bar gold, by payment in its own notes, at the rate of £3 : 17 : 9 per oz. standard. The difference is about equal to twenty days' interest at 3 per cent.

Where a charge is made for coinage, it may perhaps be said that there is a mint price. The following are the coinage terms in some principal countries with open mints:—

GOLD.

Great Britain .	no charge.
United States .	no charge.
France . .	about ¼ per cent.
Germany .	about ¼ per cent.
Holland . .	from $\frac{9}{10}$ to $\frac{4}{10}$ of 1 per cent.

SILVER.

British India .	$2\frac{1}{10}$ per cent.[1]
Mexico . .	$4\frac{3}{4}$ per cent.

Where the mint is closed against either metal and purchases are made for coinage on government account, the mint price is necessarily the same as the market price. R. W. B.

MINTAGE, FREE. The power of free mintage of gold was granted to any one who brought standard gold and silver to the English mint by the act of 1666 (18 Chas. II. c. 5), which, commencing with the statement "whereas it is obvious that the plenty of current coins of gold and silver of this kingdom is of great advantage to trade and commerce," in order to encourage this "plenty," enacted that "plate or bullion of gold or silver should be assayed, melted down, and coined with all convenient speed, without any defalcation, diminution, or charge for assaying, coinage, or waste in bullion." This act, as will be perceived, established free mintage for both gold and silver in this country. With respect to silver, the act of 1798-1799 (38 Geo. III. c. 59), prohibited further silver coinage, and the statute of 1816 (56 Geo. III. c. 68), which established the coinage of silver money on its present basis, practically restricted free coinage to gold bullion only. This act was repealed, but was re-enacted in substance by the coinage act of 1870. The gold bullion coined in England is practically all received through the Bank of England, which makes a charge of 1½d. per ounce for delivering gold coin without delay in exchange for the bullion. Similar enactments, with slightly different rates of charges, are in force in France, Germany, the United States, and the other principal countries of the world.

[1] Closed since June 1893.

[*Report of International Monetary Conference.* Paris, 1878, with Appendix by Mr. Dana Horton. —W. A. Shaw, *The History of the Currency, 1252 to 1894.*]

MIR is the modern survival of the ancient free Russian village community. In its conditions of land tenure, it resembles the eastern and western mark system. Both probably came from a common Aryan origin. As now constituted, each village has its *Mir* or popular assembly administered by an "elder." The *Mir* itself, however, performs the periodical assessments and distribution of the common land, which is cultivated on the "three-field system" by the whole community working together. After harvest, the fields are common pasture. Owing to the encroachments of neighbouring large proprietors, the communities seem to have lost their ancient rights of common woods and pastures. When required, these are now rented from the neighbouring landowner. Each household may, by repaying the sum advanced by the state for its acquisition, become the private owner of land; and this, says Mr. Kovalevsky, "unless communistic doctrines come to the rescue, threatens the *Mir* with extinction."

MIRABEAU, VICTOR RIQUETTI, marquis de (1715-1789), sometimes described by his pseudonym as *L'Ami des Hommes*, or distinguished from his son, the Comte de MIRABEAU, by the names of Mirabeau *père*, Mirabeau *aîné*, the elder Mirabeau, or the marquis of Mirabeau.

He was born at Perthuis in Provence, where his ancestors, the Riquetis, had settled in the 13th century after being driven out of Italy. In his youth he served as an officer in the army, and was decorated for his bravery in the Bavarian campaign. In 1737 he succeeded to his father's title and estates, and quitted the army, soon afterwards embarking upon the studies of rural and political economy, in pursuit of which he exhibited unwearied energy for half a century. He came early in life under the influence of the views of CANTILLON, but subsequently became an enthusiastic adherent of QUESNAY and one of the leaders of the PHYSIOCRATS. Quesnay indeed was the quasi-sacred founder of the sect, and originator of its creed, but Mirabeau was the militant chief of the school; and, after Quesnay's death in 1774, he became its acknowledged head. The history of his domestic severities, his protracted quarrels and fifteen years of lawsuits with his wife, and his rigour towards his children, which drew down upon him the jibe that he was at once *l'ami des hommes et l'ennemi de sa femme et de ses enfants*, show us that, like ROUSSEAU, he was sometimes unable to harmonise the sourness of his conduct with the sweetness of his counsels. But they also make more than ever remarkable the amazing activity with which he found time to carry out numerous hardy and unremunerative agricultural experiments, to act as the social centre of the ÉCONOMISTES (*q.v.*) at his Tuesday receptions, and to produce a crop of propagandist literature in books, in newspapers, in letters, and in lectures, almost unequalled in volume and in vigour; while his tenderness for his mother and his affection for his brother, the bailli de Mirabeau, with whom he exchanged upwards of four thousand lengthy letters equally devoted and didactic, prove—what is otherwise abundantly clear—that his family troubles would not have arisen without the gravest faults on the side of his wife and his sons.

Educated, as he says, in a mountain château by "a tutor at thirty crowns," and quitting college at the age of thirteen, the marquis of Mirabeau owed his erudition chiefly to his own application and assiduous study. In 1747 he wrote an (unpublished) *Testament politique* for the guidance of his son, as yet unborn; and inspired by ambition for the aggrandisement of his family, urged the future enemy of aristocratic privilege to defend his order against encroachments of the royal power! The reactionary tone of this document is little in keeping with his later views. He continued to ruminate upon the art of government: "12 principles laid down in 12 lines, and graven in the head of the prince or his minister would," he thought, in 1749, "if strictly carried out in detail, correct all the abuses of society and bring back the age of Solomon." A friend of VAUVENARGUES, an admirer of MONTESQUIEU, and presenting in himself, as DE TOCQUEVILLE has observed, the spectacle of a feudal character invaded by democratic ideas, he was already given to philosophise upon statesmanship, and wrote a *Système politique de la France*, which remains in manuscript. But it was in 1750 that he published anonymously his first treatise, the *Mémoire concernant l'utilité des États provinciaux*, 12mo, Rome;[1] a plea for a measure of decentralisation and local self-government, considered by Lavergne to be the most substantial of his voluminous economic and political works, and at first attributed by a judge so competent as D'ARGENSON to Montesquieu himself. Contrasting the systems of the *pays d'élection*, where the repartition of taxes was effected from above by the authority of the intendant, a royal officer, and the *pays d'état*, where the repartition rested upon the local and mutual decision of the taxpayers, he concluded strongly in favour of the latter as more equitable and more profitable to the treasury, and recommended the general establishment of local assemblies adopting its best features. His views contributed largely to the creation of such bodies in 1787; but they were swept away with the monarchy before they could take root. (For *pays d'élection* and *pays d'état* see INTERNAL CUSTOMS AND TOLLS.)

In some manner not yet accounted for, Mirabeau had obtained, and for many years retained, possession of the unpublished manuscript of Cantillon's *Essai sur la Nature du Commerce en général*, when the rightful owner recovered the *Essai* and caused it to be printed and published in 1755. The manuscript had made a deep impression on Mirabeau. At one time he seems to have intended to modify and publish it as his own. Subsequently he proceeded to write a running commentary upon the *Essai*, and it is the work thus commenced which appeared, subsequently to the publication of Cantillon's manuscript, under the title of *L'Ami des Hommes, ou Traité de la population*, in three parts, with the imprint à Avignon, 1756, 4to and 12mo. This remarkable treatise created the greatest sensation throughout the whole of Europe. It is said to have gone through forty editions, and was translated into several languages. Its anonymous author, soon discovered, became the idol of the day, and was generally referred to by the sobriquet which he had chosen for the title of his book. The meridional vivacity of his style, his wit, his naïve egotism, his piquant irony and frequent paradox gave him a great literary vogue, and led some of his readers to compare him to MONTAIGNE; while the importance of his subject and the ability of his views, in

1 "Rome" was a false imprint. The book was really published in France.

turn original, daring, and profound, earned for him the more durable attention of those who cared rather for the matter than the style. The prodigal luxuriance of his ideas, unconnected by any firm and consistent grasp of principle, makes his book comparable to a pathless tract of tangled jungle, and renders it impossible to summarise it succinctly. But its leading assertions are the following: Population is the source of wealth, and the means of subsistence are the measure of population. Agriculture is the great source of subsistence. A large population is desirable; and to this end the encouragement of agriculture is the means. "Men multiply like rats in a barn if they have the means of subsistence." Luxury, idleness, and public debts are to be reprobated. The very rich are "like pikes in a pond." The influx from country to town should be counteracted and absenteeism should cease. Religious toleration, free trade—internal and external,—a more equal distribution of wealth, a diminution and more equitable partition of the burdens of taxation, are among the *desiderata* for the economic improvement of the country; and a ministry of agriculture should be created for its encouragement and support, to keep pace with the aid which science can render to agriculture, and to favour the development of canals, modes of communication, drainage, etc. The peasant is everywhere to be held in honour, and the king's ideal should be to be a *roi pasteur*. The hardihood of the author may be sufficiently indicated by two quotations. In his preface he personifies "la voix de l'humanité qui réclame ses droits"; and in his conclusion he apostrophises the king in favour of that class of his subjects which is "the most useful of all, those who see beneath them nothing but their nurse and yours—mother-earth; who stoop unceasingly beneath the weight of the most toilsome labours; who bless you every day and ask nothing from you but peace and protection. It is with their sweat and (you know it not!) their very blood that you gratify that heap of useless men who keep saying that the greatness of a prince consists in the value, and above all, the number, of favours he divides among his courtiers, nobility, and companions. I have seen a tax-gathering bailiff cut off the wrist of a poor woman who clung to her saucepan, the last utensil of her household, which she was defending from distraint. What would you have said, great Prince?" etc.—Evidently some of the qualities of the younger Mirabeau were inherited from his father.

After reading *L'Ami des Hommes*, QUESNAY, who agreed with many of the author's opinions, desired to make his acquaintance, and Mirabeau has left a graphic account of their interview, in which Quesnay persuaded him that wealth is the source of population, not population the source of wealth. Mirabeau now became the fervent admirer of Quesnay, and between them they founded the school of the physiocrats. As Madame de Pompadour's medical attendant, Quesnay was unable to quit his post at Versailles day or night. His position at the court also imposed upon him some delicacy and reserve in openly criticising the government. The tempestuous marquis supplied in himself more than enough of initiative, energy, courage, and resource. The deference which he always exhibited to Quesnay enabled the latter to hold him somewhat in check by frequent correspondence, reading his proofs, chastening his style, and amending his views. But the impetuosity of Mirabeau was not to be wholly curbed; and he remained to the last perhaps the most independent member of "the sect."

In 1758 appeared a continuation of *L'Ami des Hommes* (pt. 4, no imprint; 4to and 12mo), in which the hand of Quesnay is plainly visible. It consists of a *Dialogue entre le Surintendant d'O. et L. D. H.*, a reprint of the *Mémoire sur les États provinciaux*, with a reply to objections which had been published against it, and a series of, separately paged, *Questions intéressantes sur la Population, l'Agriculture, et le commerce proposées aux Académies et autres sociétés sçavantes des Provinces*, asking for local information upon agricultural conditions, and also suggesting some general considerations somewhat in the style of Berkeley's *Querist*. These questions, the reader is informed, are not by the author of the *Mémoire sur les États provinciaux*. In 1760 appeared the fifth and sixth parts, without publisher's name or place of publication,—the whole forming three quarto or six 12mo volumes. The fifth part contains the essay written for the prize of the Berne Agricultural Society in 1759 on the reasons why Switzerland should prefer to grow corn. This is followed by extracts from the first six books of an English work, translated from Hale's *Complete Body of Husbandry*. The sixth part (no separate title page) is made up of a *Réponse à l'Essai sur les Ponts et Chaussées, La Voierie, et les Corvées*, and by the *Tableau Oeconomique avec des explications*. Mirabeau had already denounced the CORVÉE in his *Mémoire*, and he now replies to a supporter of them. His "explanation" of Quesnay's *Tableau* involves some manipulation of the original in order to make it comprehensible to himself and others. But it is doubtful whether Mirabeau with his small capacity for consecutive reasoning ever fully understood the harder-headed Quesnay any more than he had rightly understood Cantillon.

The same year which terminated the *Ami des Hommes* saw the publication of a *Théorie de l'Impôt*, (1760, 4to and 12mo, no imprint), a work of considerable ability which seemed

likely to create an almost equal stir. No one could doubt who was the author. "Seigneur," he begins, in the tones already noticed of exhortation and of hardly-veiled menace, "Seigneur! you have twenty millions of subjects, more or less, all with a little money and almost all capable of rendering you such service as you require; and yet you can no longer obtain service without money nor money to pay for service. In plain language, your people hold back from you without knowing it, for they are still well-disposed to your person even though they be not to the agents of your authority." And he puts into the mouth of the king the soliloquy that his position as the head of his people is justified only so long as, and only because, he costs them less than he is worth to them. If, as the author asserts on his first page, "nous sommes en un siècle mol et craintif," he shows clearly enough that he is himself not lacking in temerity. He was, for his boldness, imprisoned (16th December 1760) in the chateau of Vincennes. The king was furious against him; but ultimately yielded to Madame de Pompadour and Mirabeau's friends, and allowed him to be liberated on Christmas eve, with orders to reside at his property at Bignon, and not in Paris. For two and a half years the physiocrats held silence in the press, and taught by word of mouth. In 1763 Mirabeau made a convert of DUPONT DE NEMOURS, who, writing in 1769 of the *Théorie de l'Impôt*, says, "This sublime work has to my knowledge been multiplied by eighteen editions." It is not, as might be supposed, a mere plea for the IMPÔT UNIQUE. It proposes a reorganisation of financial administrative machinery, the abolition of the Fermes (see FARMER-GENERAL), a reduction in the taxation upon salt, with the object of increasing the total yield, and a special tax upon tobacco farms. The DOMAINE, the post, and the MINT were to be further sources of revenue. Many just and valuable remarks on taxation are scattered throughout the volume, and entitle the author to rank as one of the earliest important writers on the subject. In 1763 appeared his *Philosophie rurale*, Amsterdam (Paris), 4to, "the best, or the least bad," says DAIRE, "of all his works." It is the most complete and compact account of his physiocratic views, for which the reader is referred to the article PHYSIOCRATS, and owed a good deal to Quesnay, by whom, Dupont states, the whole of the seventh chapter was written.

Mirabeau received the grand cross of Wasa from Gustavus III. of Sweden on the foundation of the order, and counted among his other notable admirers and correspondents, Leopold, grand-duke of Tuscany, afterwards Emperor of Austria, Stanislas-Augustus, king of Poland, and KARL FRIEDRICH, grand-duke of Baden. The dauphin boasted that he knew *L'Ami des Hommes* by heart; but, when it was proposed to place the *Éphémérides* under his protection, though Quesnay, Dupont, and TURGOT agreed to the plan with its prospect of shelter from too rigid censorship, and though the dauphin had himself approved of the terms of the proposed dedication, Mirabeau refused to be a party to the project, and threatened to withdraw if it were adopted. His threat, which prevailed, indicates his dominant influence in the party and his independence of his colleagues. As has already been indicated in the course of this article, Mirabeau was one of the first to perceive an important principle of POPULATION, and to express a belief in what has since been called the elasticity of the exchequer; but his chief economic importance lies in his powerful support of physiocracy.

The limits of this article admit of little more than an enumeration of his other principal works. According to M. de LOMÉNIE (*q.v.*) he left forty volumes, besides several unpublished writings. His popularity waned after the lawsuits which followed upon his quarrel with and separation from his wife in 1757, the odium which he incurred from the stern measures he adopted to repress his profligate and spendthrift son by imprisoning him at Vincennes and elsewhere, under *lettres de cachet*, and the success of the latter in unjustly inflaming the public mind against an *Ami des hommes*, whom he painted as a demon of harshness and inhumanity. It could hardly fail to lend colour to prejudice that the writer who declaimed so vigorously against absenteeism was hardly ever present in his own property, that, much as he disapproved of public debts, he incurred with fatal facility an increasing burden of private loans, that for an expert in rural philosophy his agricultural experience was singularly unfortunate, and that having denounced *lettres de cachet* in his writings he employed them against his own household in profusion. He died 13th July 1789, the day before the storming of the Bastille.

His later writings often appeared anonymously and in foreign countries, by the care of his friends. Such are *Les Devoirs*, Milan, 1770, 8vo, seen through the press by the Marquis de Longo, professor of political economy at Milan. (Men should receive economic instruction as a guide to conduct. And so elementary education should be *compulsory, and free* where the recipient cannot afford to pay). —*Entretien d'un jeune Prince avec son gouverneur par L. D. H.*, Publié par M. G. . . . (l'abbé Grivel), Paris, 1785, 4 vols. 8vo and 12mo.—*Hommes à célébrer pour avoir bien mérité de l'humanité par leurs écrits sur l'Économie politique. Ouvrage publié par P. Boscovitch, ami de l'auteur*, Bassano, 2 vols. 8vo.—Mirabeau was one of the principal writers in the ÉPHÉMÉRIDES du citoyen (1765 to 1768), and the *Journal de l'agriculture, du commerce, et des finances* (1764 to 1774).—Among his other works may be mentioned *Réponse du correspondant à son banquier*, 1759, 4to (a reply

to Forbonnais).—*Éléments de philosophie rurale*, La Haye, 1767, 12mo (an abridgment of the *Philosophie rurale*).—*Lettre sur le commerce des grains*, Amsterdam and Paris, 1768, 12mo.—*Les Économiques par L. MIRABEAU, Honoré Gabriel Riquetti, Comte de (1749-1791), born at Bignon near Nemours, and died in Paris.

A son of the Marquis of Mirabeau (*q.v.*), the many wild incidents of his stormy life and the extraordinary force of his character caused him to occupy a very different position in general history from his father. The political career of the son is bounded by little more than two years (1789-1791), but during them he won an immense though an evanescent influence, and seemed for a moment as if he would have swayed the whole course of the revolution. "One can say that, had Mirabeau lived, the history of France and of the world had been different," Carlyle, *French Revolution* (chapter on "Mirabeau"). Here, however, we are concerned only with his economic reputation, which was far inferior to that of his father.

Though not a dogmatic economist, he employed his wonderful eloquence on subjects distinctly economic in character. Setting aside his dissolute youth and certain works regrettable for his reputation, and willingly omitting his acrid political writings, his pamphlets on *La Caisse d'escompte, la Banque Saint-Charles, la Compagnie des eaux*, and even his *Dénonciation de l'agiotage*, though they are polemical in character and directed against individuals and particular interests, and his speeches at the national assembly deserve attention, peculiarly the *Discours contre la banqueroute* (26th September 1789). The speeches and opinions of Mirabeau were published by Barthe in 1820, 3 vols. 8vo, and more recently by M. A. Vermorel, 5 vols. 12mo, in the *Bibliothèque Nationale*. A. C. f.

[See also Loménie, Louis de.]

MIRO, Vicenzo de (18th century), was regent of the supreme council of Italy. Charles VI. emperor of Germany and archduke of Austria, appointed him president of the commission of 1718, summoned to organise a new census for the state of Milan. This census was celebrated in the history of taxation. The object of the system proposed was to remedy the inequalities of the Estimo (*q.v.*) fixed in 1548, and to establish a fair proportion between the payments of the contributors.

The commission presided over by Miro fixed the basis of the taxation, proposed the regulations required, and almost completed the whole work. Miro remained in office until 1731. The labours of the commission were interrupted by the war in 1733. The work was resumed in 1749 by a second commission, under the presidency of Pompeo Neri (*q.v.*). This was dissolved in 1758. A government commission rearranged the Catasto (*q.v.*) in 1760.

[Carlo Lupi, *Storia dei principii delle massime e delle regole seguite nella formazione del catasto prediale introdotto nello stato di Milano l' anno 1760*. Milan, 1825.] U. R.

MISSELDEN, Edward (early 17th century). was deputy-governor of the merchant adventurers company at Delft between 1623 and 1633, and negotiated a private treaty with the Dutch and the East India Company, who employed him from 1624 to 1628 in their negotiations about the Amboyna outrages. He had various missions on behalf of the merchant adventurers. The appointment of the standing commission on trade in 1622 give rise to his—

Free Trade, or the Means to make Trade flourish; wherein the causes of the decay of trade in this kingdom are discussed, and the remedies also to remove the same are represented (Lond., 1622, 8vo, reprinted in 1651). The author points out (I.) the causes of the want of money here, which are (*a*) the value of English coins. These are current at a higher rate in Holland, whither the money is attracted. (*b*) The excessive consumption of foreign commodities. (*c*) The want of an East India stock here. (II.) The causes of the foreign want of money, which are (*a*) the recent wars; (*b*)

the trades maintained out of Christendom with ready money. The causes of the decay of trade are found by Misselden to be the scarcity of money and the want of the East India stock, also usury and heavy lawsuits. The fish trade is decayed by the encroachments of strangers on our coasts. The disturbances in the cloth trade, the ill-making and false-sealing of cloths, are also blamed. The export of wool and wool-fells is a grievance; and the author censures the merchants adventurers for their heavy impositions on English cloths. Ch. iii. deals with monopoly; and ch. iv. with the want of government in trade. The remedies proposed by Misselden are to make foreign coins current at equal value with our own, and so keep the money in the realm; to reform excessive consumption of foreign commodities by allowing only certain imports, say of the tobacco grown in Virginia or the Bermudas only. Merchant ships ought, he says, to go in fleets together for safety. The remedy for usury he finds to be the plentiful circulation of money and bills of exchange, and he advocates the total uprooting of monopolies. MALYNES (*q.v.*) attacked Misselden as overlooking "the predominant part of trade"—viz. the mistery of exchange. The latter replied in *The Circle of Commerce: Or the Balance of Trade, in defence of Free Trade, opposed to Malynes Little Fish and his Great Whale, and poized against them in the scale; wherein also exchanges in general are considered*, J. Dawson for N. Bourne, Lond., 1623, 4to. A. L.

[*Dict. of Nat. Biogr.*, xxxviii. pp. 51-2.]

MISTERY (or MYSTERYE; MYSTERY is a form dating from the 17th century), was a common designation in the later middle ages for a body of persons engaged in a particular branch of manufacture or trade, not in their capacity as individuals but as an organised group. It has no etymological connection with *μυστήριον*; and its association with that which is "mysterious" belongs to an age when its original meaning was forgotten. It is derived from the Latin *ministerium*, through the mediæval form *misteria*; and it was used precisely in the same way as the French forms *mistere*, *mestrer*, *mestier*, and *métier*. Its introduction into England was probably due to the use of French in official documents; and the native English term, which was used side by side and interchangeably with it, was *Craft*. W. J. A.

MOFFAT, ROBERT SCOTT (19th century): The author of *The Economy of Consumption: An Omitted Chapter in Political Economy* (1878), in which MILL'S theory of capital, his doctrine that there cannot be a general over-production of commodities, and other approved tenets and authors, are subjected to a hostile criticism. The practical outcome of the work is to recommend as "the true policy of the labourer" what is called a time-policy—that is, the limitation of the hours of the work, rather than of the rate of the wages. A portion of the work relating to this policy is reprinted as a separate book, entitled, *The Principle of a Time-Policy, being an Exposition of a Method of Settling Disputes between Employers and Labourers in regard to Time and Wages by a simple process of Mercantile Barter, without recourse to Strikes or Locks-Out* (1878). In the preface some reviews of the preceding work, one of them by CLIFFE LESLIE, all of them exceedingly unfavourable, are quoted at some length and rebutted. The author further enforces his principle in a letter to Lord Justice Bramwell on the *Regulation of Production*. He also wrote *Henry George the Orthodox*.

F. Y. E.

MOHEAU. This statistical writer of the 18th century scarcely received at the time the due acknowledgment of his deserts. Even his book *Recherches et Considérations sur la Population de la France*, was attributed by Lalande, in the *Journal des Savants*, to MONTYON, who (see Meitzen, *History of Statistics*) assisted in the work. The first portion of the *Recherches* contains statistical tables, the second is devoted to the analysis of various causes likely to influence population.

The dedication "*à un roi*" is dated 1774, and the permission to print it, 1777 (*Dict. de l'économie Politique*, art. "Moheau.")

Moheau's work was published in Paris, Montard. 1778; 2 books of 280 and 160 pp. in 1 vol. 8vo

[M'Culloch, *Literature of Pol. Econ.*, p. 264, speaks highly of it, moreover recommending his book as a model for similar work.] A. L.

MOHL, ROBERT VON (1799-1875) was successively professor of political science in the universities of Tübingen and of Heidelberg, an official in Wurtemberg, the minister of justice of Germany under the government of the Frankfort parliament of 1848, and the representative of Baden at Frankfort and Munich (1861-1871). At his death he was a member of the German Reichstag representing an electoral district of Baden.

His literary activity was considerable, his subjects being public and administrative law. His two principal works are the *Polizeiwissenschaft* (3rd ed. 1832-34, 1844-45, and 1866) and the *Geschichte und Litteratur der Staatswissenschaften* (1855-58). Mohl does not take the word *Polizei* in its present restricted sense of repressive justice, but in the wider sense of internal and administrative state-policy, as it was often understood by old German and French writers. According to his own definition, the *Polizeiwissenschaft* is "the systematically ordered science, which explains the principles on which the state ought to interpose to protect its citizens against overpowerful external hindrances," but his book only deals with the principles of the science in the *Rechtstaat*, or legal state, by which he means the state "where the collective life of the nation is so ordered that each individual member is helped and assisted towards the utmost possible free and many-sided display and utilisation of his individual energies." In the *Rechtstaat*, the scope of the state is thus mainly negative, although many not purely negative interferences may be sanctioned on motives of expediency and in new cases. For instance, Mohl would not be adverse, in cases of over-population, to compul-

sory emigration enjoined according to a lottery arranged much on the same basis as the military conscription in force on the continent. For all this, on the whole and in principle, the views of Mohl are those of a liberal statesman.

Mohl's *Geschichte und Litteratur der Staatswissenschaften*, is not written on the ordinary plan of a continuous history of development, but under the form of bibliographical monographs. It is a real monument of both historical and critical learning. It only deals with modern states after the end of the middle ages.

[Cohn, *Hist. of Pol. Econ.*] E. Ca.

MOHUR. The Indian government mohur is a token gold coin valued formerly at the sum of 15 standard silver rupees. It weighs 180 grains (the same weight as the silver rupee), and is composed of gold of the millesimal fineness of 916·6. Its intrinsic value in sterling is £1 : 9 : 2¼ (11/12 fine), whereas the gold value of 15 rupees, owing to the low price of silver, has been fixed since 1893 at £1 (1 rupee = 1s. 4d.). The gold coins of India are, however, in practice bought and sold as bullion.

Besides the mohur there are gold pieces of the nominal value of 30, 10, and 5 rupees; these coins being proportionate in weight to the mohur, and of the same fineness. Prior to 1835 mohurs of slightly different values were issued in the three presidencies. The Madras mohur was of the same weight and fineness as the present coin; that struck in Bombay weighed 179 grains of gold 920 fine; while that issued at Calcutta was, from 1818 onwards, of the weight of 204·7 grains, 916·6 fine, and from 1793 to 1818 had been of the weight of 190·894 grains, 995·7 fine.

[R. Chalmers, *A History of Currency in the British Colonies*, 1893.] F. E. A.

MOHUR, History of. A gold coin of northern India (Persian *muhr* "a seal"). Like the silver Rupee, the gold mohur probably represents the old Indian weight of 100 *ratis* (seeds of *Abrus Precatorius*), or about 175 grains, and dates back perhaps to Vedic times. Its weight has fluctuated with the endeavour to maintain a ratio between silver and gold. Thus, in the 14th century the weight of the mohur was raised to about 200 grains, but gradually reverted to the ancient type. In 1766 the East India Company struck for Bengal a mohur, which for the first time was declared to be a legal tender of payment, as the equivalent of 14 sicca rupees; its gross weight was 179·67 grains, 833·33 fine, containing 149·72 grains of fine gold. In 1769 the Bengal coin was increased in gross weight to 190·773 grains of *sequin* fineness, containing 190·1 grains of fine gold, which was to be legal tender for 16 sicca rupees. In 1818, when the fineness was reduced to eleven-twelfths in accordance with the Company's principle of 1806 (see *infra*), the gross weight of the Bengal 16 rupee mohur was raised to 204·7 grains, making the fine weight 187·6 grains. In Bombay the mohur was not legal tender, but was approximately the equivalent of 15 Bombay rupees. From 1774 its gross weight was 179 grains, the millesimal fineness being 953 in 1774, and 920 from 1800 to 1833, with the result that the fine content of the "old" mohur was 170 grains as against 164·7 grains for the newer coin dating from 1800. Lastly, in 1818 the Company struck a mohur for Madras, which was to be a legal tender to government alone at 15 rupees. The following principles, which were embodied in the Madras coin of 1818, were laid down by the Company in 1806: "Although we are fully satisfied of the propriety of the silver rupee being the principal measure of value and the money of account, yet we are by no means desirous of checking the circulation of gold, but of establishing a gold coin on a principle fitted for general use. This coin, in our opinion, should be called a gold rupee, and be made of the same standard as the silver rupee, viz. 180 troy grains gross weight, and 165 troy grains fine gold." In 1835 by Act XVII. the Company, in striking one uniform coinage for the whole of its dominions, and in establishing the Madras mohur as the type for the new Company's mohur, enacted that "no gold coin shall henceforward be a legal tender of payment in any of the territories of the East India Company." The same principles were observed as regards the government mohur by Act XIII. of 1862, when the Company's rule came to an end, and again by section 12 of the India Coinage Act, 1870. The weight and fineness of the coin have not been changed since 1818.

[Bengal, *Regulations of the East India Company*, Nos. xxxv. of 1793, xlv. of 1803, xiv. of 1818;—India Office records.—Sir James Steuart's *Principles of money applied to the present state of the coin of Bengal*, 1772.—Yule, *Hobson-Jobson, Gloss. of Indian Terms used in English*, 1886, pp. 438-39.] R. C.

MOIDORE (Portuguese). The Moeda de Ouro (or gold money) was a Portuguese coin issued from about the year 1640 to the year 1732. It was of the millesimal fineness of 916·6 and weighed 83 grains, being, therefore, of the sterling value of 13s. 5½d. A double Moeda de Ouro was also issued, and it is to this coin, which had a world-wide circulation, that the name "moidore" is usually applied. F. E. A.

The coin known by this name, also called the Lisbonnine, was reckoned equal to 10 crusados or 4000 reis; in 1688 Peter II. raised its rating to 4800 reis. Its uniform goodness, fineness, and weight, soon made it a favourite coin both in Europe and in the British colonies. Early in the 18th century, for instance, it was the chief coin current in Ireland, and had established itself in the West Indies, more particularly at Barbados.

In Ireland it had appeared before the close of the 17th century, coming in, as Sir Isaac Newton tells us, in course of trade; rated at 28s. it was over-valued, and drove out silver and other gold, so that at the beginning of the 18th century, according to a contemporary writer, they were "reduced to moydores, the most inconvenient coin of all others in our present circumstances." Before the rating was reduced the coin had also spread over into, and become common in, the West of England.

In Barbados, whither it came about 1705, it passed for 35s. till 1715, and afterwards at 37s. 6d. And, although Mr. Chalmers calls it comparatively unimportant in the West Indies as compared with Spanish gold, in Barbados for many years the moidore was the usual coin named in local advertisements, and was clearly the most prominent coin in the island.

In spite of not being struck after 1732, it long remained in circulation, and only gradually gave way to its successor the Johannes (*q.v.*). The popular rating of the coin in English money was 27s., based on Sir Isaac Newton's rating in 1717, when he distinguishes between doppia moeda "new coined" 26s. 10⅔d., doppia moeda "as they come to England," 26s. $9\frac{8}{10}$d.

C. A. H.

MOLESWORTH, Sir William (1810-1855), eighth baronet, was educated in Germany; he afterwards went to Cambridge, whence he was expelled for challenging his tutor. He completed his studies at the university of Edinburgh. Molesworth was M.P. for East Cornwall from 1832 to 1837, following generally the lead of Grote, to whom he had been introduced by C. Buller. In 1835 he founded the *London Review*, which, after a few numbers, first by itself, and then of joint life with the *Westminster Review*, was finally, in 1837, absorbed in the latter. Molesworth's most noteworthy contributions are stated to have been "On the Orange Conspiracy," and "On the policy of the Radical Party in Parliament," (*London and Westminster Review*, April 1836 and January 1837). From 1837 to 1841 he represented Leeds in parliament. In the former year he obtained a committee of the House to inquire into the system of Transportation (*q.v.*), and wrote the report, which strongly recommended its discontinuance. The four years 1841-45, during which he had no seat in the House, were mainly devoted to editing the works of Hobbes (*q.v.*). He returned to parliament in 1845 as member for Southwark, which seat he held till his death. From this time he chiefly applied himself to questions connected with the colonies. He strongly advocated the granting to them of complete self-government, and supported the views on colonisation of E. Gibbon Wakefield (*q.v.*). There appears to have been considerable satisfaction in the colonies, when, after being first commissioner of works in Lord Aberdeen's government in 1853, Molesworth was made by Lord Palmerston, in 1855, secretary of state for the colonies. His period of office was too short for him to fulfil such expectations, but it may be noted that an act of his, in appointing a Canadian to the governorship of the Windward Islands, pointed the way to a method of consolidating the empire which is, at length, being followed. Molesworth was not a man of much originality of mind, nor a great orator or debater. He only spoke after laborious preparation, and his speeches, many of which were published, were of the nature of essays. He deserves notice as the first of the radicals to attain cabinet rank, though the peculiar kind of philosophic radicalism to which he adhered found little favour, on some grounds, with other members of the party.

[Molesworth's only literary work except articles in reviews, none of which were republished, and speeches, was an edition, in 17 volumes, of the *Works Latin and English of T. Hobbes*, London, 1839-46, 8vo.—See *Notices of the late Sir W. Molesworth* (privately printed), London, 1857, 8vo.—The *Dictionary of National Biography*, vol. xxxviii. notice by Mr. Leslie Stephen, which refers to *Philosophic Radicals of 1837* (privately printed) by Mrs. Grote, London, 1866.]

H. E. E.

MOLINA, Ludovicus (1535-1600), a distinguished Jesuit theologian of the 16th century, was a Spaniard by birth, and taught at Coimbra and Evora in Portugal. He was the author, among other works, of a treatise *De Justitia et Jure* (1593-1600), which dealt at considerable length with usury and the relation between business practices and moral theology (see Interest and Usury). It was reprinted more than once, after his death, and exercised considerable influence on the subsequent development of economic thought.

[W. Endemann, *Studien in der romanisch-kanonistischen Wirthschafts- und Rechtslehre* (i., 1874, ii., 1883), treats him as a signal example of that method of argumentation which, in his opinion, finally took away all practical force from the earlier canonist doctrine, see especially, i. 385, ii. 118, 249; cp. Ashley, *Econ. Hist.*, i. pt. ii. 452.]

W. J. A.

MOLINÆUS, Carolus, the Latinised name of Dumoulin, Charles (1500-1566), a distinguished jurist of Paris, was the author of *Extricatio Labyrinthi de eo quod interest*, and *Tractatus contractuum et usurarum redituumque pecunia constitutorum* (both in 1546), and of some other pamphlets on the problem of usury. In these, especially in the *Tractatus*, he criticised the canonist doctrine with a freedom which aroused a storm of condemnation. He was

forced to leave France, and his book was condemned to be burnt and put on the *Index*. In 1553 he accepted a professorship at Tübingen, and soon afterwards became a member of the council of the Duke of Würtemberg.

The opposition he encountered is not to be attributed to his practical conclusions, which scarcely went beyond some contemporary canonists of high authority, as NAVARRUS DE AZPILCUETA. Like them Molinæus approved of a regulation of interest by authority, and condemned uncharitable dealings. What seems to have distinguished him was his attack on the theory of usury itself,—his denial that all payment for the use of money was forbidden by holy writ, and bad in itself. The point at issue might seem to be a purely verbal and technical one: whether gain could be contracted for in consideration of a "loan" (MUTUUM) *eo nomine*. According to the current definition of the canonists, *mutuum* involved so complete a transference of property, that payment for the *use* became inconceivable. But what was really involved was the whole conception of usury, which the Roman Catholic Church was not disposed to abandon, and has not abandoned to the present.

[Endemann, *Studien*, i. p. 62.—Böhm-Bawerk, *Capital and Interest* (Eng. trans.), p. 29.—Ashley, *Econ. Hist.*, pt. ii. p. 454.] W. J. A.

MOLLIEN, FRANÇOIS NICOLAS, Comte, (1758-1850) born at Rouen and died at Paris, was one of the ablest administrators of finance during the first empire. He began at the age of sixteen in the office of the FARMER-GENERAL, which he left in 1791 for cotton-spinning in the environs of Evreux (Eure). In 1799 the first consul summoned him back to office, and entrusted him with the administration of the sinking fund, then just instituted. Mollien discharged the duties of his office with the most absolute honesty and with great ability, order, and punctuality. The emperor, who highly appreciated these qualities, appointed him, 27th January 1806, minister of the treasury in the place of Barbé-Marbois, who had been unable to defend himself against the insidious manœuvres of Ouvrard. Mollien held this post during the empire and the *cent jours*. From 1801 to 1815 the treasury was separated from the department of finance, strictly so called, and constituted a separate department. Under the restoration and the government of July, Mollien accepted no public office, though he was twice offered the administration of finance in the early part of the reign of Louis XVIII., but in 1819 he was made a peer and in this quality sat in the Luxemburg until 1848.

In many pamphlets on subjects of the day (1818), in parliamentary reports and some scattered notes, Mollien produced work of great value. He began to write, after 1817, his *Mémoirs d'un ministre du trésor public*, 1780-1815, 4 vols. 8vo, 1845. In 1837 a first, but very imperfect, edition was published. This remarkable work has never been on sale, and copies of it are very rare. The absorbing personality of Napoleon I. did not allow Mollien's talents their full value; but his memoirs exhibit the solidity of his intellect, the sincerity of his statements, and the breadth of judgment which he applied to the incidents passing under his eyes, and to the events on which it is to be regretted that he had not a greater influence. Mollien was a man of strong character, and notwithstanding his devotion to Napoleon, who in his eyes represented France from 1800 to 1815, he maintained the right of expressing his opinions freely and his independence. At the council of state before 1806, and as minister of the treasury, he had often to oppose the ideas of Napoleon, who, however, was never displeased with him. He even sought his conversation and invited his criticism. Napoleon was not displeased with the boldness of Mollien, who after his conversations with the head of the state reproduced the whole of them in his memoirs. This gives that book its great importance. It is known that Mollien's father, a leading merchant, put the *Wealth of Nations* into the hands of his son as soon as the translation of Germain GARNIER was published. The reading of this early fixed Mollien's views on the great truths of economics, as the perusal of his memoirs proves.

[See W. Bagehot's *Econ. Studies* (ed. 1880, p. 2), and his reference to Napoleon's phrase *Ce bon Mollien qui me donne des francs pendant que les autres ne me donnent que des idées.*—Also Cl. Jannet in *Le Capital, la spéculation et la Finance au XIX^e siècle* (1892).] A. C. f.

MOLMEN were a class of manorial tenants defined by Vinogradoff (*Villainage in England*) as "rent-paying tenants who may be bound to some extra work, but who are very definitely distinguished from the 'Custumarii,' the great mass of tenants who render labour services." He regards them as standing below the freeholders, but as having risen from real serfdom by getting their tenure fixed and their services commuted, drawing this distinction between *mal* (a Danish word = rent) and GAFOL, that the former was a commuted, the latter an original money payment. If this view is correct—and the matter can hardly be regarded as settled—the chief interest of molmen and of their holdings, "molland," is the illustration they afford at an early period of the process by which the villeins in general afterwards became free. The word is of fairly frequent occurrence, especially at the time of Edward I.

[*English Hist. Review*, articles by Elton and Vinogradoff, July 1886, Round, January 1887, Stevenson, April 1887. For law of dower and female inheritance among molmen and for some differences between "mollond" and "werklond," see Archdeacon Hale, *Domesday of St. Paul's.*] E. G. P.

MOLSTER, JOHANNES ADRIAAN (1827 1889).

A Dutch lawyer and writer of essays on public subjects in reviews, was the author of a *Geschiedenis der Staathuishoudkunde* (Amsterdam, 1857), a history of political economy, interesting for the information given in it on Dutch economic literature. E. Ca.

MONCADA, Sancho de (beginning of the 17th century) lectured on theology in the university of Toledo, and published, in 1619, eight *Discursos* on various economic subjects, which were the uncompromising expression of the prohibitive tendencies then prevalent in Spain, and, consequently, obtained a wide celebrity among his countrymen. They were republished at Madrid in 1746 under the title *Restauracion Política de España*. Moncada does not admit for a moment that the wars abroad, the system of laws, the excessive number of idle persons, the debasement of the currency, etc., could fairly be looked upon as responsible for the depressed state of Spain: "the misfortune of Spain flows from the trade with foreigners, who carry away our raw material and our silver," p. 9, ed. 1746. His only remedy is the prohibition of exports of raw materials and precious metals, and of the imports of manufactured articles, enforced by the penalty of death pronounced against smuggling, and the delivering to the Inquisition of all persons accused of exporting money, "as this money is going to assist the enemies of the church," p. 40 of the 1st Discourse, *Riqueza Firme de España*. Still Moncada is aware that the influx of American gold and silver, had brought about the general rise of prices, which had put Spanish industry at a disadvantage in its competition with foreign countries, where the rise of prices was proceeding more slowly, *Disc.* on *España con Moneda*, p. 54.

Moncada concludes by demanding the erection of a special university for political science in Madrid, and the institution of lectures on the same subject in the provincial universities. These lectures are to be delivered in the vernacular language, not in Latin, pp. 147-159.

[Colmeiro, *Hist. de la Ec. Pol. en España*, ii., pp. 333-334.] E. Ca.

MONDAYLAND. See Lundinarium.

MONEDA FORERA, a poll tax levied first every seven and then every five years, by the kings of Castile, and paid as an acknowledgment of their royal prerogative. In time of financial distress the *Cortes* often granted at once three, five, or more *monedas*. E. Ca.

MONEDA, Pedidos, or Servicios (*Peita* or *Pecha* in Aragon), are the names given to the extraordinary subsidies voted by the *Cortes* of Castile. They were apportioned, but in a very irregular way, amongst the inhabitants according to their presumed means; it was considered by some towns a valuable privilege to be exempted from them by their *fueros* or charters. It was officially admitted that "they yielded little and left the fields untilled"; still many of them became permanent, under the name of *servicios ordinarios*. Noblemen and the clergy were exempted from the *servicios ordinarios*.

[Canga Arguelles, *Diccionario de la Hacienda* (London, 1826).] E. Ca.

MONEDAGE, a general tax levied in Aragon on all movable and real property. Knights were the only persons exempted from *monedage*. E. Ca.

MONETARY CONFERENCES (International). Four times in recent history the leading powers of the western world have met together by diplomatic arrangement to confer on monetary problems. These four great conferences, known as International Monetary Conferences, *par excellence*, were held at Paris in 1867, 1878, 1881, and the fourth in 1892 at Brussels. International conferences on monetary questions are, however, not restricted to these. The German states before the foundation of the empire, Germany and Austria, the Scandinavian kingdoms, the papal states, and the countries of the Latin Union, have held many monetary conferences of an international character, but only the four great conferences, in each of which over twelve countries were represented, are included in the scope of this article.

France and the countries of the Latin union enjoyed the privilege of a certain reciprocity in monetary policy, and the benefits of a common monetary unit many years before the formation of the Latin union in December 1865. The men who were instrumental in bringing about the union entertained bright dreams of the possibility of an international union of much greater dimensions, and of the establishment of an international money based on a common unit of value and standard of weight and fineness. The success attending French efforts in outlining the policy of the Latin union led her government to undertake the greater task of relieving the commerce of the world of the difficulties and inconveniences of international exchange. Hence France sent out invitations to all the powers to join her in a conference to this end to be held in Paris, June 17th, 1867. Previously France had, through diplomatic correspondence, submitted copies of the Latin union treaty to the powers, and called special attention to the clause whereby other states might be admitted, and asked at the same time for a statement and discussion of the objection that any state might have to becoming a party to this compact. The idea at the basis of the conference called was in reality the extension of the treaty of 1865, though the invitations stated that "the commissioners will assemble without any programme arranged in anticipation—(and)—the conference proposed has not otherwise any immediate object than to call

out an interchange of views and discussion of principles; in a word to seek for the bases of ulterior negotiations."

Representatives of eighteen of the principal countries of Europe, and the United States of America, assembled under the presidency of the French minister of foreign affairs, and subsequently under that of the vice-president of the conference, the distinguished writer on money, M. de PARIEU, who at that time was vice-president of the French Council of State. Eight sessions in all were held, and the whole discussion centred in the question of uniformity of coinage. Few signs were visible of the "battle of the standards," "the future of silver," "bimetallism," etc., and similar questions which have been the all-absorbing topics of subsequent conferences. Following the order of topics arranged by an international committee, able and dignified discussion was given to all difficulties which might arise from any attempt to unify the coinage of different nations. The U.S. expressed itself willing to coin a gold dollar and its multiples, equal in weight and fineness to 25 frs., and urged France to issue a coin of this value, and England to reduce the sovereign to the value of 25 frs., and change its fineness from $\frac{11}{12}$ to $\frac{9}{10}$ fine. The cost and difficulty of re-coinage was thoroughly discussed, and the commissioners soon gave up any idea that may have been entertained of applying uniformity to any other than gold coins of which there seemed to be a relative scarcity, but which the majority of the countries seemed determined to introduce as soon as possible.

The first decision reached by the conference was that the cost to the several nations of adapting their coinage systems to some known and existing system would be less than in the case of the adoption of an entirely new system, and that under existing circumstances the Latin union treaty of 1865 offered the best basis for a general agreement. Secondly, gold was declared to be the only standard suited to international money; Prussia, the most important silver-standard country represented at the conference, voted also for gold, it being agreed that some time might be necessary in which a transitional silver or double standard would obtain in silver-standard countries. The Netherlands was the only country to vote against the gold standard. It is interesting to note that Mr. Ruggles, the representative of the United States, declared emphatically that the United States had the gold standard, though the double standard existed legislatively but had been virtually abolished in practice. A scarcity of gold was, however, feared, and a resolution was adopted to the effect that "in countries that have had the silver standard up to this time, as well as in those of the double standard, that the relation between the value of gold and silver should not be established at a rate too low to permit the serious introduction of gold." It is significant that Prussia voted "no" on this resolution, and the United States refused to vote.

Additional dignity and importance was attached to the conference by the Emperor of France deputing Prince Jerome Napoleon to preside over the sessions after the fourth session, and the fact that the Prince emphasised in strong language the chief aim of the conference and the hope that practical results in the shape of international diplomatic treaties on the subject would be accomplished. So positive a statement rather frightened the English delegates, and Sir Rivers Wilson reminded the president of the purely deliberative character of the proceedings according to the terms of the invitation, and further declared that England would occupy a very independent position with respect to changing her system of monetary units, weights, and standard to conform to any continental system.

The question of desirable fineness was readily settled at $\frac{9}{10}$ standard, and a unanimous vote declared that "there should be types with a common denominator for weights in gold coins of identical fineness." The five-franc piece was adopted as the common denominator, although a larger unit (*e.g.* ten francs), met with some favour in the discussion, and England and Sweden voted against the five-franc piece. It was further agreed that gold coins, with the common denominator of five francs, should have legal circulation in the states mutually bound by the monetary treaties. The twenty-five franc piece was added to the list of coins, though the fifteen franc piece, intended to harmonise with existing coinage in Holland and in South Germany, was rejected by a close vote.

With this the labours of the conference practically ended. The delegates supposed that they had found the basis of a fixed and fundamental international system of money in adopting the gold standard, coins of equal weight and fineness, and divided according to the decimal system with the five-franc piece as a unit. Such understanding applied only to gold coins: each state was to remain free to coin silver for change in any way it pleased.

France agreed to assume responsibility for re-convening the conference if further negotiation was necessary after replies had been received from the various governments upon receipt of the proceedings of the present one; an answer was requested on or before 15th February 1868. England favoured a much longer period of delay, and several other countries preferred some extension of the time to permit the question involved being discussed in their respective legislatures. The conference adjourned with buoyant hopes of success on 6th July 1867, but the results of its labours never met with a sufficiently successful response on the part of the powers to warrant a re-convening of the conference.

Certainly no more praiseworthy, prudent, and intelligent effort to bring about uniform coinage has ever been made, but it merely demonstrated that any such uniformity among nations, differing widely in habits and customs, cannot be secured at one blow, but must come, if ever, as the result of a very gradual evolutionary process.

The second international monetary conference was called by the United States of America in pursuance of an act of congress dated 28th February 1878, which directed the President to invite the governments of Europe to join in a "conference to adopt a common ratio between gold and silver for the purpose of establishing internationally the use of bimetallic money, and securing fixity of relative value between those two metals." Faith in international bimetallism as a remedy for monetary evils had gained ground since 1867. The silver production of the U.S. had attained immense proportions, and had secured as an industry great political influence in congress. The U.S. silver commission had made an elaborate report in 1876. Germany was well established on a gold basis, and German silver had disturbed the market and threatened greater depreciation. Some form of international bimetallism seemed feasible, and the question of ratio, it was thought, was the great obstacle which a conference might settle. The conference met in Paris, 16th August 1878. Twelve countries were represented. Germany alone of the great powers declined to participate.

The United States submitted two propositions:—(1) "It is the opinion of this assembly that it is not to be desired that silver should be excluded from free coinage in Europe and the United States of America. On the contrary, the assembly believe that it is desirable that the unrestricted coinage of silver, and its use as money of unlimited legal tender, should be retained where they exist, and, as far as practicable, restored where they have ceased to exist." (2) "The use of both gold and silver as unlimited legal tender money may be safely adopted: first, by equalising them at a relation to be fixed by international agreement; and secondly, by granting to each metal at the relation fixed equal terms of coinage, making no discrimination between them."

These propositions were discussed at great length, and much documentary evidence was presented, from several countries, bearing on their coinage and their attitude towards silver. The collective answers of the European powers, with the exception of Italy, to the propositions of the United States were presented at the seventh and last session, 29th August, in the following form:—"The delegates of the European states represented in the conference, having maturely considered the proposals of the representatives of the United States, recognise (1) that it is necessary to maintain in the world the monetary functions of silver as well as those of gold, but that the selection for use of one or the other of the two metals, or of both simultaneously, should be governed by the special position of each state or group of states. (2) That the question of the restriction of the coinage of silver should equally be left to the discretion of each state or group of states, according to the particular circumstances in which they may find themselves placed; and the more so, in that the disturbance produced during the recent years in the silver market has variously affected the monetary situation of the several countries. (3) That the differences of opinion which have appeared, and the fact that even some of the states which have the double standard find it impossible to enter into a mutual engagement with regard to the free coinage of silver, exclude the discussion of the adoption of a common ratio between the two metals." The delegates of the United States, in replying to these answers, stated that they had come to the conference expressly to enter into a mutual engagement for the free coinage of silver, and that the failure of attaining any practical results did not rest with them. The Italian delegates maintained that the conference "in systematically avoiding to pronounce itself upon the possibility or impossibility of a fixed relation, to be established by way of international treaty, between coins of gold and silver, leaves its task unfinished." They further claimed that the French ratio could be maintained by France, England, and the United States.

The third international monetary conference was convened by joint action of the French and American governments, "to examine and adopt, for the purpose of submitting the same to the governments represented, a plan and a system for the establishment of the use of gold and silver as bi-metallic money according to a settled relative value between those metals." The conference met at Paris in July 1881, and held thirteen sessions.

Nineteen countries were represented. At the close the following declaration was made in the name of the French and American governments:—"(1) That the depreciation and great fluctuations in the value of silver relatively to gold are injurious to commerce and to the general prosperity, and the establishment of a fixed ratio of value between them would produce the most important benefits to the commerce of the world. (2) That a bi-metallic convention entered into by an important group of states for the free coinage of both silver and gold at a fixed ratio and with full legal-tender faculty, would cause and maintain a stability in the relative value of the two metals suitable to the interests and requirements of commerce. (3) That a convention which should include England, France, Germany, and the United States, with the concurrence of other states, which this combination would assure, would be adequate to produce and maintain throughout the commercial world the relation between the two metals that such convention should adopt. (4) That any ratio now, or lately, in use by any commercial nation, if so adopted, could be maintained, but that the adoption of the ratio $15\frac{1}{2}$ to 1 would accomplish the object with less disturbance to existing monetary systems than any other ratio."

This declaration met with outspoken opposition especially from Mr. Forsell of Sweden, who said that it was better to acknowledge at once that bimetallism had collapsed, and that the resolutions of the European delegates at the conference of 1878 should be re-affirmed. The conference adjourned to 12th April 1882, to give time for further instructions from the several governments and scope to diplomatic negotiations, but was never reconvened.

At the international exhibition of 1889 at Paris, an attempt was made to organise a monetary conference. A number of sessions were held and many eminent persons took part. The report of the discussions can be found in the general reports of the exhibition. This conference, however, is rarely mentioned as one of the international conferences, because no official importance was attached to its proceedings, and its delegates were not appointed directly by their respective governments for this purpose.

The fourth international conference was called by the United States "for the purpose of conferring as to what measure, if any, can be taken to increase the use of silver as money in the currency systems of nations." It met at Brussels, 22nd November 1892, and held ten sessions, adjourning 20th December to meet 30th May 1893. Twenty countries were represented. As the United States called the conference, it was expected that the American government would have some definite plan to present for securing the end in view—an increase in the use of silver. The instructions to the American delegates were extremely vague, simply saying that they should do all in their power to "bring about a stable relation between gold and silver . . . (and) to secure, if possible, an agreement among the chief commercial countries of the world looking to international bimetallism . . . (and) failing to secure international bimetallism . . . to secure some action upon the part of European countries looking to a large use of silver as currency, in order to put an end to the further depreciation of that metal." After some delay at the beginning of the conference, the representatives of other countries refusing to express any opinions until the United States presented a plan, the following general declaration was made on the part of the United States delegation:

1. That the re-establishment and maintenance of a fixed parity between gold and silver, and the continued use of both as coined money of full debt-paying power, would be productive of important benefits to the world.

2. That these ends can be accomplished by removing the legal restrictions which now exist on the coinage of silver into full legal tender-money, and restoring by international agreement the parity of value between the metals which existed prior to 1873 at such ratio as may be decided upon by this conference.

3. That the essential provisions of such an international agreement should be

1. Unrestricted coinage of both gold and silver into money of full debt-paying power.
2. Fixing the ratio in coinage between the two metals.
3. Establishing a uniform charge (if any) to the public for the manufacture of gold and silver coins.

The discussion of this programme, which was so general and contained nothing but a re-statement of the old bimetallic position, soon proved futile and destined to come to nought. The American delegates said that the complications arising from their ignorance of the public law of the different European countries made it impossible for them to outline a more detailed scheme except after much discussion on the part of the conference. They called attention to a plan which had been proposed at the conference of 1881 by M. Moritz Levy to withdraw gold coins and notes of less value than 20 francs, and that of Adolph Soetbeer which was published in the *Hamburgische Börsenhalle* for 23rd August 1892, and in the *Neue Freie Presse*, Vienna, 20th September 1892, shortly prior to Dr. Soetbeer's death. Dr. Soetbeer proposed:

1. The acknowledgment of a fixed weight of pure gold as a universal basis for currency.

2. Recoining all gold and issuing no gold coins of less than 5·8065 grammes of pure gold (= 20 francs or $3.96) at mint charges of 2 per thousand (= $\frac{2}{10}$ of 1 per cent) and agreement to withdraw from circulation all smaller gold coins within a period of ten years.

3. Issue of gold certificates for gold deposits in amounts, or multiples, of 500 grammes of pure gold, upon actual deposits of coin.

4. Retirement of all paper money representing less than the value of 5·8065 grammes pure gold and to issue no more.

5. Retirement within fifteen years of all silver coins current with a value of more than 10 per cent of the fixed minimum gold coin, and coining major silver coins to be receivable for all public dues by the country issuing them, to any amount, at the ratio of 20 to 1; to be legal tender to thrice the amount of lowest gold coin; coinage only on government account.

6. Subsidiary silver coins to be issued as each country may determine.

7. Silver certificates to be issued only against actual deposits of major silver coins, in denominations of half the smallest gold coin or any multiple.

8. Mutual reports of laws and operations to be exchanged annually.

9. Withdrawal from compact only upon one year's notice.

These two propositions, together with that of Baron Alfred de Rothschild, for the establishment of a union of the governments represented, into a syndicate which should guarantee the purchase of £5,000,000 sterling worth of silver annually for five years, provided the price did not go up beyond 43 pence per ounce standard, and also provided the United States government continued its purchases of 54,000,000 of ounces yearly,

received the chief share of attention at the conference. Suggestions, looking to the withdrawal from circulation of small notes and small gold coins in order to force more silver into use and the issue of silver certificates on bars, and schemes requiring privileged banks of issue to hold silver as well as gold reserves, had been made at the conference of 1881 but had attracted little attention. The discussion of such measures, looking to the increased use of silver, but maintaining strictly the gold standard, was the characteristic feature of the Brussels conference. The plans already mentioned, as well as others made by M. Tietgen, Sir Wm. Houldsworth, M. Allard, M. de Foville, M. Forsell, M. M. Levi, and M. Sainctelette, were referred to a special committee of twelve, which made two reports, in one of which the plan of M. Moritz Levy was favourably recommended. The president of the conference declared that he found it impossible to keep the ensuing discussion to the subject before the conference, namely, the report of the committee; it would expand in all cases to a discussion of the general principles of bimetallism. It was therefore agreed that the simple proposition of the United States, respecting bimetallism, be taken up. Long discourses followed; that of Senator Jones of the United States, which covers 100 folio pages of the *Procès-verbaux*, going into the greatest detail. A few sessions of aimless general discussion sufficed to show that no agreement could be reached between the advocates of the single and double standard. The usual statements that the other countries must wait for England to take the initiative in a bimetallic union were made, and the usual device, adjournment for further advice from the several governments, was followed. The conference adjourned, to meet 30th May 1893, but was never re-convened. The debates of this last conference were less original and of less value than those of any of the preceding ones. The questions discussed had become firmly rooted in the politics of the various countries, and the discussion was consequently less free and untrammelled. The specific propositions for temporary, if not permanent, relief of generally admitted congested monetary symptoms, which to some extent distinguished the Brussels conference from its predecessors, can hardly be said to have received the discussion and adequate consideration they deserved, so intense was the feeling on the general bimetallic controversy.

Since the adjournment of the Brussels conference the parliaments of England and Germany were both compelled by strong political pressure to pass resolutions (House of Commons, Res. 26th February 1895, German Reichstag, Res. 16th February 1895) favouring another conference, and the congress of the United States, just previous to its recent adjournment, passed a resolution (3rd March 1895) providing for the appointment of delegates should a new conference be called. Later (July 1895), all interested parties were looking to the chancellor of the German empire to take the initiative in calling another conference, but he did not relish the responsibility, being disinclined to take action until forced to do so by the agrarian-bimetallic party in Germany. On 17th March 1896, the House of Commons agreed to a resolution urging on "the Government the advisability of doing all in their power to secure by international agreement a stable monetary par of exchange between gold and silver." No immediate action however appears likely to follow.

[The official proceedings of the various conferences have been published in the French language under the general title *Conférence Monétaire Internationale*, Procès-verbaux. The dates of these publications are as follows:

(1) *Pub. of the Ministère des affaires étrangères*, Paris, Impr. imp., 1867.—(2) Ditto, Paris, Impr. nat., 1878.—(3) Ditto, 2 vols. *a.* Sessions 1 to 8, avril-mai, 1881. Paris, Impr. nat., 1881, p. 341. *b.* Sessions 9 to 13, juin-juillet, 1881, p. 226, Paris, 1881.—(4) *Conférence Monétaire Internationale*, 1892, Procès-verbaux. Bruxelles, 1892, p. 424.

These official reports have been translated into the various European languages by the various governments that participated. For English translations, see the following:

S. M'C. L.

MONEY. The term "money" is applied to any commodity, whatever its substance or its form, which, whether by law or by convention, becomes the common medium of exchange in any community. The difficulties of BARTER or TRUCK, that is of direct exchange, are so great that subdivision of labour and diversification of industry can be carried but a very little way under such a system. Tribes in no very advanced stage feel the need of a common medium of exchange; hence, the history of money is almost co-extensive with the history of mankind beyond the purely savage state. Oxen were used as money among the Greeks of the Homeric period. Sheep served the Italians

at a later period, as the common medium of exchange. After the abandonment of Britain by the Romans, we find the inhabitants, in the scarcity of coin, returning to the use of "living money," especially in Scotland and Wales. "It is very possible," says Sir Henry Maine, "that kine were first exclusively valued for their flesh and milk; but it is clear that, in very early times, a distinct and special importance belonged to them as the instrument or medium of exchange." Cattle and sheep may be a good money or an inconvenient money, according to the circumstances of the community. In a pastoral state they present many advantages. They carry themselves, and thus avoid one of the objections to the employment of grain. The opportunities for grazing which everywhere exist, and the familiarity of all persons with guarding and tending animals, reduce the trouble and risk of using them. On the other hand, cattle and sheep have two serious drawbacks as money. The first is, that each animal represents too large an expenditure of labour to answer in small purchases. Even calves and lambs scarcely meet the requirements of "change." The second drawback is, want of uniformity in quality. Even in a picked herd or flock there is great room for choice. If goods are sold for cattle or sheep, the buyers will pay in the smallest and lankiest specimens to be found. This was the experience of the Massachusetts colony so long as cattle were received in payment of taxes. If such disadvantages attend the use of "living money" even in a pastoral state, the cost of keeping them and the risk and trouble which attend their nurture and custody in any highly civilised state are so great as absolutely to preclude their use. Of the cereals, wheat, corn, and rye have extensively fulfilled this office. These and other grains have two important qualifications for such use: (1) the being in universal request for consumption as food; and (2) in allowing almost indefinite subdivision. But they are subject to two serious drawbacks: (1) in the great weight of a quantity which represents a day's labour; and (2) through their liability to deterioration from rust, insects, excessive moisture, undue heating, or the mere passage of time.

The literature of travel is full of stories regarding the rice money of the Coromandel shore, the cacao money of the aboriginal Mexicans, the oil money of the Ionian islands, the rock-salt money of Abyssinia, the wampum money of the early New Englanders, the tobacco money of Maryland and Virginia in the same period, the tea money of the Russian fairs, the date money of the African oases, the beaver and sealskin money of many northern countries, and a host of other commodities adopted, in one place or another, for meeting the requirements of a common medium of exchange. One great class of substances have a peculiar importance in the history of money, from the earliest times and amid a wide circle of nations. The metals, especially seven of them, have been found to possess in a high degree the material properties required. Iron, lead, tin, and copper, one or another, early became the money of most of the countries whose history is known. The money of Lacedæmon was of iron; and this metal, at least until recent times, served the inhabitants of Senegambia; Sweden, when impoverished by the wars of Charles XII., went back to the use of Copper Money (*q.v.*). Lead was extensively employed in exchange by the early Romans and the early English; and is still given and taken in Burmah in small payments. Tin was used by the Mexicans as money, even after silver and gold were known. It was long so employed in Sweden; and more recently served in that capacity among the Chinese, along the shores of the Malay peninsula, and in Prince of Wales' Island. Of the four metals named, however, copper has the greatest importance in the history of money. From its higher cost of production it superseded iron when that metal came, in the development of mining industry, to possess a value for its bulk unsuited to the uses of exchange; while yet silver was too precious for the ordinary transactions of daily life. During the silver famine of the middle ages, copper came back to be the principal money of the people of Europe. The employment of copper in a diminishing degree has continued in Europe and America nearly down to our own day; but this metal, or recently the closely allied bronze, has now sunk in all civilised states to the rank of "token-money," or change. Over no small part of the world, however, it is still an important element in the monetary circulation. We have now to speak of a fifth metal. Between 1828 and 1845 the emperor of Russia sought to bring platinum into use as a money metal; but the effort failed, owing to the extreme difficulty of rendering that metal from ingots into coin, and from coin into ingots, as the exigencies of exchange might require.

Of all the metals, two have enjoyed a pre-eminence in the history of money which has given them the name of the Precious Metals. Not that they are the most costly. Several are more valuable even than gold; but this is true only of metals found in extremely limited quantity, like iridium or venadium, far below the requirements of a general medium of exchange. Of the two precious metals, silver was first used as money. We read of it in early Hebrew history. It was long coined by the Greeks and Romans, while gold remained merely treasure, devoted to regal and sacerdotal

uses. The extreme beauty of silver, with its numerous applications to the economy of life, make it an object of admiration and desire among people of all degrees of social advancement. Easily fusible, highly ductile, nearly imperishable, silver would have filled our utmost conception of a money-metal did not the earth yield one transcendent product, in comparison with which even silver fades from desire. "The compendious value of gold," to use Mr. Jacob's expression, allowing a vast amount of purchasing power to be concentrated for conveyance or concealment in little bulk; its durability, its fusibility, ductility, and malleability, properties of the highest importance for the purposes of coinage and circulation, and its numerous uses in the industrial and decorative arts,—all these combine to make it chief of money-metals.

The foregoing are among the articles which have served the world in one stage or another of social advancement, as the common medium of exchange. It is of the essence of money that all persons who have anything to sell shall take it as a matter of course. The extensive use of an article in exchange does not necessarily make it money. Those transactions, however numerous and important, may be nothing but acts of barter. So long as men take an article in exchange, having any great degree of uncertainty as to their finding a person who will take it from them; so long as men accept it with the feeling that it is something which they are buying, and which they will have to sell over again, something for which they must needs hunt up a purchaser, that article is not money. Anything to be money must have acceptability so nearly universal that practically every person who has any product or service to dispose of will freely take it, in preference to seeking, at the time, the specific products or services which he may require from others, since he is fully assured that with this thing, money, he can, at times and in form and in amount to suit his immediate necessities, obtain what he shall desire. Each person, thus, whatever his place in the industrial order, accepts money without reference either to his own need to consume any of the particular article so used, or to the character or the credit of the person who offers it. When he has anything to sell, he takes money from any man, because he knows that any other man will take it from him whenever he wishes in his turn to buy. If an article reaches this degree of acceptability, it becomes money, no matter what it is made of or why people want it. The carved pebbles formerly used by the Ethiopians, the wampum which circulated in the 17th century between the New England colonists and the natives, the glass beads used along the Arabian Gulf, the shells and red feathers employed throughout the isles of the Indian Ocean, were all money, though capable of serving no purpose but that of ornament and decoration.

We have thus far spoken of the principal, the characteristic function of money, namely, that of the common medium of exchange. This is the distinguishing office of money. Whatever does this is money. But incidentally, money performs another important service to exchange, namely, by furnishing a price-list, or price-current, of all articles in the market. Since these are, by turns, exchanged for money, each is expressed in terms of money; and, in consequence, all can at once and readily be compared among themselves as to value. The value of any article in terms of money is called its PRICE. The foregoing office of money has been termed by economists generally that of a measure of value; but that term is not descriptive, and has proved highly misleading. A better statement would be that money in this connection fulfils the office of the common denominator in exchange, or denominator of values (see DENOMINATOR, COMMON). The numerators consist of the prices of the several articles in the market; and, inasmuch as the denominator is common to all, these can readily be compared among themselves. Some economists have made the mistake of speaking of this as an independent, and even as the principal office of money. Thus, Mr. MILL says that "the first and most obvious" of the inconveniences of doing without money would be "the want of a common measure of values": and Prof. Francis Bowen says, "We can do without money as a medium of exchange, and can even barter commodities for other commodities without the use of any medium. But we cannot do without money as a common standard or measure of value." Even Prof. Jevons writes as if one article might serve as a medium of exchange, while another might serve as a measure of value, in the same community. But it ought to be perfectly evident on a moment's reflection that it is only by, and through, an article being used as the common medium of exchange, that we obtain the prices which make up the price-list or price-current. Consequently, if we did without money as the medium of exchange, we should perforce have to do without it as the denominator of values. Having thus seen the two ways in which money, even in societies but a little advanced industrially and commercially, facilitates exchange, allowing the division of labour to be carried out to its economic maximum, time and place considered, we are prepared to make a better statement than that yet offered regarding the primitive function of money; and we say that money serves as the common medium of exchange: (*a*) dispensing with "the double coincidence of wants and of possessions," to use the phrase of

Prof. Jevons, which is involved in direct exchange; (*b*) furnishing a price-current of all commodities in the market.

Regarding the philosophy of money in its uses thus far described, there is practically no difference of opinion among economists of standing. The value of money is admitted by all to be governed by the operation of the ordinary law of demand and supply. There being—in any community, at any time, according to the state of the arts and according to the extent to which the division of labour has been carried,—an economic need or demand for a certain amount of money-work to be done, in carrying commodities from producers to consumers, the quantity of the money-thing which is available to do that work will determine its value. If shells constitute the money of a community living by the sea, then, if there be much exchanging to be done, that is, if there be a large demand for shells to effect exchanges, and if shells be scarce, each shell will have a high value. Prices will be correspondingly low, that is, a large amount of commodities will sell for but few shells. If the supply of shells be suddenly increased, as by a great storm bringing them up on to the shore, the value of shells will fall; that is, prices will rise. The relation of the value of primitive money to cost of production is, with a single exception to be hereafter noted, the same as in the case of any commodity not used as money. If the cost of production of that which serves as money is diminished, as by improvements in an art or by the discovery of new resources in nature, the supply will be increased, and its value will fall in consequence, that is, prices will rise. If the cost of production of that which serves as money is increased, as by the exhaustion of natural resources, its supply will fall off; its value, demand remaining constant, will be enhanced, that is, prices will fall. The exception above referred to is that noted by Mr. Mill, namely, that, while a prospective increase or decrease of supply, in the case of any commodity not used as money, generally results in its price falling or rising without awaiting the marketing of the new supply, the value of money only changes—demand being all along assumed constant—with the actual changes of supply, inasmuch as prices are the result of real exchanges of commodities for money.

Having thus stated the law of primitive money, let us now proceed to observe the action of money in societies industrially and commercially advanced, and into which credit enters. In such societies, goods are not always exchanged for money at the time; an equivalent is not always or perhaps habitually given on the spot. Future payment is often stipulated for; and a new money-function appears, that of the standard of deferred payments. We are thus able to give a full and final definition of money, namely, that it is that which serves (1) as the common medium of exchange, (*a*) dispensing with the double coincidence of wants and of possessions involved in barter; (*b*) furnishing a price-current of all the commodities in the market. (2) As the standard of deferred payments. To put it in another form, money is that which passes freely from hand to hand, in full payment for goods, in final discharge of indebtedness, being accepted equally without reference to the character or credit of the person tendering it, and without the intention on the part of the person receiving it himself, to consume or enjoy, or otherwise use it than by passing it on, sooner or later, in exchange.

The introduction of credit into the commercial and industrial society, devolving upon money the additional function of a standard of deferred payments, has hindered the unanimous concurrence of economists as to what money exactly is, and as to what money exactly does. The use of credit instruments, the introduction of bills of exchange, drafts, and cheques, and the accumulation of deposits in banks, introduce an element into the philosophy of money which it is difficult to resolve to the satisfaction of all thinkers and writers. Some insist on regarding every form and instrument of credit as a part of the monetary circulation; some on treating bills of exchange and bank deposits, at any rate, in this way; others, still, regard bank deposits, at the least, as money, since cheques are freely drawn on these for the discharge of indebtedness. Lord Overstone (see Jones Loyd) may be regarded as the leader of the school of writers who classify bank deposits as money. Prof. Sidgwick holds the same view, and would alter the definition given above by substituting the words "from owner to owner," in place of the words "from hand to hand." A great deal is to be said on either side of this question, and there is no present reason to suppose that a general agreement on the subject can be reached. The writer contents himself with presenting his own reasons for holding that credit instruments generally, viz. bank accounts, bills of exchange, and cheques drawn on deposits in bank, should be excluded from the category of money.

These reasons are as follows:—Let us revert for a moment to the primitive condition of industry and trade, before credit has been introduced. Money serves here as the general medium of exchange; yet barter may in many instances be resorted to. These acts of direct exchange reduce, to that extent, the field for the operation of money. They diminish, by just so much, the money work to be done, and by consequence, the demand for money. But no one looks on them as a part of the money supply; no one regards acts of barter as in any sense constituting a use of money. In an

advanced industrial and commercial state, credit limits the field for the operation of money, as barter did in a primitive state. The mutual cancellation of indebtedness, which the introduction of credit effects through the use of book accounts, bank deposits, etc., withdraws a certain, it may be a vast, body of exchange transactions from the field in which money operates; but within that field, thus reduced, money does its work in precisely the same way, and as completely under the ordinary law of supply and demand (see DEMAND; SUPPLY AND DEMAND) as, in the primitive state, money did its work within the field of exchanges which had been diminished by barter. After all that credit can do in the mutual cancellation of indebtedness, there still remains, in the community most highly advanced, even where banking has been carried to its utmost limits, a vast volume of transactions which must be effected by the use of money. The sufficient proof that these must be effected by the use of money is found in the fact that they are so effected, for money would not be used, since its use involves expense, unless this were economically necessary. Money being thus necessarily employed over a vast field of exchange transactions, after all the efficiency of credit is exhausted, the value of money within that field is determined precisely as it was determined before credit was introduced. There being a certain quantity of the money-work to be done, the quantity of the money-thing available to do that work fixes its value. If there be more of it, its value will fall and prices will rise. If there be less of it, its value will rise and prices will fall. The exchange transactions which, in the result, are cancelled by the use of credit, simply diminish by so much the field in which money would otherwise operate. In this respect they correspond exactly to acts of barter in primitive communities. It is true that if the quantity of money be diminished and its value in consequence rises, there will be an economic effort to expand the range of the mutual cancellation of indebtedness, since, as was said, the use of money always involves a certain expense; while, if the quantity of money be increased, there will be a tendency to relax efforts to secure the widest possible cancellation of indebtedness, and in consequence, a larger body of exchange transactions will involve the use of money. But it remains true that, however the field in which money operates may be broadened or narrowed by such a cause, it is that field which determines the amount of money-work to be done, that is, the demand for money; while the supply of money will be in nowise affected except as its higher or lower value at the time may stimulate or retard its production.

But it may be asked, if bills of exchange and bank deposits are not to be treated as money, shall bank notes be so regarded? We may answer, "Yes." Bank notes do the money-work and are therefore the money-thing. When issued by institutions of undoubted solvency, they pass freely from hand to hand, in full payment for goods, in final discharge of indebtedness, leaving no trace of their course, such as cheques and bills of exchange do through successive endorsements. They are accepted without reference to the character or the credit of the person who offers them, except solely as the bad character of that person might require more scrutiny to ascertain that the notes were genuine. His mind satisfied on that point, whoever has sold goods receives the notes of solvent banks precisely as he would receive gold or silver coin, even though the man offering them were a well-known rogue. Bank notes are, therefore, in every sense, money. Bills of exchange and bank deposits are merely instruments for the mutual cancellation of indebtedness, and are not money.

We have thus passed through the entire extent of the functions of money, dwelling long enough upon each to be able to see what money is and what money does. In order to anticipate objections and to resolve doubtful cases, it is, however, desirable to speak more at length of each of these functions by turns. And, first, of the medium of exchange, that is, of money as dispensing with the double coincidence of wants and of possessions, implied in barter. It will be observed that every use of money involves a double transaction. Instead of commodities being exchanged directly for each other, each in its turn is sold for money; and the commodity desired is purchased with that money. There are, thus, two transactions in place of one; but, as the acceptance of money is universal and a matter of course, those two transactions involve less, probably far less, possibly almost indefinitely less, effort than would direct-exchange, where it is essential to find some one who not only wants what you have, but has what you want. In order to secure and maintain the universal acceptability of money, it is, in primitive societies, necessary that the article adopted for this use shall be some material thing, having intrinsic properties which make it an object of general desire for its own sake. When, however, we advance to contemplate highly civilised societies, we find them sometimes using as money an article whose value depends entirely on convention or law. Bank notes are not things useful in themselves; while the difference between a bank note for five, and a bank note for ten pounds exists only in the substitution of one arbitrary symbol for another. Mutual confidence or legal authority entering, it ceases to be essential, however desirable it may continue to be, that the article used as money shall be something having useful properties. The

savage builds his canoe of materials every part of which will float of itself; the civilised man constructs his ship out of materials every part of which by itself would sink to the bottom. The difference between savage money and civilised money is not less remarkable. It is universal confidence or universal respect for law which enables modern societies to substitute for that "material equivalent or recompense,"—to use the phrase of M. CHEVALIER—which is the characteristic of all primitive moneys, a money of mere convention, like bank notes or government paper. Yet for the same reason the possibility of a serious catastrophe always attaches to such money. If confidence fails, if the *fiat* of government is carried beyond the limits of obedience, the acceptability of the money may gradually or abruptly cease (see FIAT MONEY); and an industrial and commercial system which has been built up on the basis of such a monetary circulation may be shattered or brought to ruin. A view of these evil possibilities attending all money into which credit enters, or to which mutual confidence is essential, has caused many excellent writers, especially in America, to deny the name money to anything which is not a "material equivalent or recompense," and especially to government issues. These writers make the mistake of saying that government paper is not money, when they really mean to say that it is bad money. Now, wholly in addition to the distinction between money and not-money, we have the distinction between good money and bad money. Anything is money which does the money-work, even though it does this with less of convenience and with more of danger than would some other thing. During the paper-money period of the United States, namely, from 1863 to 1879, "greenbacks" unquestionably performed all the offices of money. They circulated with the utmost freedom; they were cheerfully and even eagerly received; men worked for them or gave goods for them, without challenge or question; they furnished a "price current" as clear and intelligible as ever did gold in such use; they were, with the single exception of the distant and isolated communities on the Pacific coast, the standard of deferred payments universally employed. Therefore, greenbacks were money. At the same time, being in excess, they inflated prices, excited to speculation, kept industry and trade in a state of agitation, and caused a continual transfer of wealth from the productive to the speculative classes. They were, therefore, bad money.

Money of mere convention has liability to two evils. The first is, that not being a "material equivalent or recompense," it is subject to be issued in excess. Especially is this true of paper put out directly by the government. Not the wants of trade, but the exigencies of the treasury, are apt to determine the amount of issues; and whenever such issues take place in excess of the wants of trade, they almost inevitably go from bad to worse. Prices become inflated, speculation sets in, and there is often both a popular and a fiscal demand for still larger issues, to sustain the inflated prices (see ASSIGNAT; BULLION COMMITTEE, REPORT OF; INCONVERTIBLE CURRENCY). Yet there are historical instances of such money being issued and maintained without excess, or, at any rate, marked excess, through the exceptional prudence and moral courage of legislators or fiscal authorities. On the other hand, as in France after the war of 1870, the natural or material forms of money cannot be increased arbitrarily. Being products of labour, they can only be increased by the application of corresponding amounts of labour to their production. They have in this a safeguard against excess which is lacking in all moneys of mere convention. The second evil liability of money of convention arises from the fact that the force of such convention has its territorial limits, whether those of a small community or those of a large state. Owing its acceptance to convention within those limits, any local excess cannot be reduced by exportation. Such money has no natural drainage. Wherever it is poured out, it makes a swamp. On the other hand, the material forms of money are subject to exportation to communities which have no respect for local convention other than their own, but which have personal or social wants that may be satisfied by the intrinsic properties of these articles. The exportability of money reaches its highest point in the case of gold and silver. The demand for these metals being universal, any local excess anywhere is at once drained off; and each community retains only so much as is required to keep its own prices on a level, cost of transportation being taken into account, with prices in the countries with which it trades. The beneficial influence of this on commerce, and in the second degree upon production, cannot be over-estimated. It is, indeed, almost essential to the maintenance of the vast system of modern production. During the paper-money period of the United States already referred to, prices, owing to the non-exportability of the GREENBACK, were out of all relation to the general prices of commerce. The exporter sold his goods for gold, and then sold the gold for whatever it would bring at the time, in the local money. Trade, and in consequence, production, became highly speculative, with the most mischievous results to the industry of the country, not to speak of grave social and political evils.

But, even in cases where, through exceptional prudence and courage on the part of the government, paper is not issued in excess, very

considerable evils may yet be produced by the use of such money. During the suspension of specie payments by the Bank of France, from 1871 to 1877, the premium on gold was, by the remarkable sagacity of the directors, kept at a very low figure, almost vanishing at every favourable turn of trade. Yet even this was not without momentous consequences to the commerce of that country. In his valuable work, *Lombard Street*, published at about the close of that period, Mr. Bagehot remarked:—"The note of the Bank of France has not, indeed, been depreciated enough to disorder ordinary transactions. But any depreciation, however small, even the liability to depreciation without its reality, is enough to disorder exchange transactions. They are calculated to such an extent of fineness, that the change of a decimal may be fatal, and may turn a profit into a loss. Accordingly, London has become the sole great settling house of exchange transactions in Europe, instead of being, as formerly, one of two."

Let us now consider the second function of money, that of the common denominator of values. There is no other point on which writers on money are so generally in error as here. The cause of that error is largely found in a vicious terminology. Having begun by calling money, in this relation, the measure of value, they seem to have felt themselves bound to show that money does measure values. Thus, Prof. Francis Bowen writes: "A measure must be homogeneous with the thing measured. As that which measures length or capacity must itself possess length or capacity, so that which measures value must have value in itself, or intrinsic value." . . . Prof. Thorold Rogers says: "We need some common measure of value as we need measures of length and capacity." And Mr. Mill, as referred to above, mentions among the first and most obvious wants of exchange that of "a common measure for values of different sorts." From this notion, that money measures values, has come the dictum, common to most economists, that a money of mere convention, not having INTRINSIC VALUE (*q.v.*), not being "a material recompense or equivalent," cannot perform this function, whatever it may do as the universal medium of exchange. It would appear that all this confusion has arisen from the use of a misleading term. If we read further in the works of these writers, we find that the function they are really treating of is merely that of a common denominator in exchange. Now, it is not essentially the office of a denominator in exchange to measure values; but only to express them, as measured. If we contemplate money of pure convention—for example, mere pieces of paper curiously engraved—and if we assume for such money a general acceptability, such as money of this kind has frequently possessed, and possesses to-day in many countries, a moment's reflection will show that, by being actually exchanged against these pieces of paper, all commodities in the market become measured as to their value, without regard to the cost of production of the money itself. If all producers desire these pieces of paper, and desire them very much, no matter for what reason, then all commodities which have a high cost of production, and are in corresponding demand, will exchange for many pieces of the paper, or otherwise the supply of such commodities would rapidly fall off; while commodities having a low cost of production will exchange for few pieces of paper, since, otherwise, the supply of such commodities would rapidly increase, which would at once bring down their price. In this way, that is, by the efforts of all producers to bring to market those commodities which will command the greatest number of these pieces of paper for a given expenditure of time and labour, all the commodities in the market will be differentiated as to value, exactly as if the money consisted of gold or silver. With a money of gold or silver the effort of each producer to bring to market the commodities which, for a given expenditure of time and labour, will command the greatest number of coins of a certain denomination, differentiates all commodities in the market as to value, without reference to the cost of production of the coins themselves. The action in the case of money of mere convention is identical; and the results are just as exact. By the mere fact of being exchanged for any kind of money, each commodity takes its place on the price-current, high up or low down, according to the demand for it, and according to the ease or difficulty with which it can be brought to market—that is, according to demand and supply. It is this conception of the function of money as a common denominator of values, which underlies the discussion of IDEAL MONEY by Sir James STEUART and Messrs. F. Percival ELIOT and Gloucester WILSON. These writers were far nearer the truth than their critics. Probably the history of philosophy furnishes no instance of an equally mischievous result from the use of a false terminology, with that which has followed the phrase, "measure of value," in its application to money.

Let us now speak of the remaining function of money, that of a standard of deferred payments. The emergence of this function, consequent on the development of the credit-system, lays on that which shall be used as money a requirement altogether additional to those made upon it in a state of society where all commodities are paid for at the time of delivery. In the earlier state, it would not matter much, if at all, should the article used fluctuate widely and rapidly as to its own cost of production or its own conditions of supply. But when credit is

given—that is, when payments are deferred,—it becomes at once of vast, if not supreme, importance that money shall remain reasonably stable in value, from time to time. It is here that money of mere convention displays its greatest weakness, since its quantity can be arbitrarily increased to any extent. Yet in this respect those forms of money which have "intrinsic value," which constitute "a material equivalent or recompense," fall far short of what is to be desired. Even gold and silver, which, owing to their practical indestructibility, remain highly stable in value from year to year, yet fluctuate enormously from age to age. The story of the spasmodic and often intermittent production of the precious metals has been told in other parts of this work (see GOLD AS STANDARD). So tremendous have been the consequent fluctuations in value that it has frequently been proposed to substitute CORN RENTS, in contracts for considerable terms of years; and, in a vast number of instances, rents, annuities, etc., have actually been stipulated for in bushels of wheat. The cereals, while they fluctuate far more than gold or silver from year to year, have been more stable, at least until a very recent date, through long periods of time. Even these, however, fall so far short of supplying all the conditions of a good standard of deferred payments, that it has been by many writers proposed to create a TABULAR STANDARD, or multiple tender, the nature and office of which will be found described under the title INDEX NUMBERS.

Another point which requires consideration in the philosophy of money is the effect of corruption or debasement of the coin—assuming, now, metal money to be in use—upon the value of money. There are two cases: (1) where corruption or debasement is universal, all coins being alike diminished as to weight, or impaired as to fineness; (2) where the coin has been irregularly corrupted or debased. In the latter situation, it is usual for writers on money to say that the principle known as GRESHAM'S LAW will at once begin to operate. This law, or theorem, which derives its name from Sir Thomas GRESHAM, the founder of the Royal Exchange of London, is, as commonly stated, that bad money invariably drives out good money. Thus expressed, the theorem is incorrect. Bad money will only drive out good money when the sum of the two is in excess of the wants of trade; that is, in excess of the amount which is necessary to keep prices in the community on a level, cost of transportation being taken into account, with prices in the communities with which it trades. So long as bad money and good money together only make up the amount which is needed, neither will drive the other out. RICARDO correctly states the principle in his reply to C. BOSANQUET: "It is a mistaken theory to suppose that guineas of 5 dwt. 8 gr. cannot circulate with guineas of 5 dwt., or less. As they might be in such limited quantity, that both one and the other might actually pass in currency for a value equal to 5 dwt. 10 gr., there would be no temptation to withdraw either from circulation. There would be a real profit in retaining them." It is only when the total amount of money comes to be in excess of the wants of trade, that exportation or melting of the coin begins. In such a situation, Gresham's law operates with almost absolute certainty. The exporter, or the manufacturer of gold or silver plate, selects for his purposes the coins of fullest weight or of the highest purity, thus withdrawing them from the circulation, whose average quality is in consequence reduced. This, however, goes on only so fast and so far as the total amount of money is in excess. Should the introduction of abraded or debased coin continue, all the better coins would, in time, be exported or sent to the melting pot.

In the second case of corruption or debasement of the coin, viz. where such corruption or debasement affects the whole body of coins, the effect upon the value of money constitutes one of the most difficult questions in the philosophy of this subject. The writer believes that the truth in this matter is wholly on the side of Ricardo. No matter to what extent the corruption or debasement has proceeded, coins will still pass for their full denominative value, provided only the amount issued be not excessive. Ricardo failed, probably from inadvertence, to affix a single proviso which is essential to the correctness of this statement, viz. that popular knowledge of the corruption of the coin should not create a popular indisposition to use the coin. If this were to take place, it would cause an extension of the field of barter or of the operations of credit. Such an extension of the field of barter on the one hand, and of the operations of credit on the other, would of itself constitute a reduction in the demand for coin, which would necessarily reduce its value, that is, raise prices. Ricardo is unquestionably right in saying that there are numerous historical instances of a coinage largely abraded or debased, circulating without a corresponding reduction, if not indeed without any reduction at all, from its proper denominative value. The purchasing power of money being determined wholly by the relations of demand and supply, government can, by limiting the supply, in a very large degree control the value of money. Ricardo even goes so far as to regard paper money as money upon which the SEIGNIORAGE (*q.v.*) is 100 per cent. But, while it is thus in the power of government, by controlling the supply, largely to influence the value of paper money, the economist who has a reason-

able reference to the nature of political forces can never give his approval to paper money not instantly and unconditionally convertible into coin of full value. As Alexander HAMILTON says, "paper emissions are of a nature so liable to abuse, and it may even be affirmed so certain to be abused, that the wisdom of government will be shown in never trusting itself with the use of so seductive and dangerous an expedient."

It has been said that money, while it has value, has not price, the latter term being reserved to express the value of other things in terms of money. This is true, so long as one article only is used as money. Let us, however, take the case of a community in which both gold and silver are used in this relation. Since gold and silver have separate sources of supply, and have also, in some measure, independent causes of demand, as *e.g.* for use in the arts, then we shall have a gold-price of silver, and a silver-price of gold. This is the situation which BI-METALLISM (*q.v.*) contemplates; and it is the effort of that system to extinguish all preference for either of these metals, at a ratio agreed upon, and fixed by law,—*e.g.* 15½ of silver to one of gold, as under the French law of 1803,—so that the gold-price of silver and the silver-price of gold shall remain constant.

[The literature of money is almost measureless. A complete bibliography would form a considerable volume. The first important writer on money was ARISTOTLE; and there is no stronger proof of the greatness of this early philosopher than that his conception of the money function still influences scientific thought. As European society emerged from the monetary confusion and disorders consequent on the silver famine of the middle ages, Nicole ORESME, moved by the abuses of the French coin, published in 1360 his treatise on money, a work which, after being long lost to the world, was, about 1862, discovered by the eminent German economist, ROSCHER, of Leipzig, and has since been put out by M. WOLOWSKI, in the original Latin text, with an introduction and a French translation. No work expresses more strikingly the pernicious effects of that *morbus numericus*, which wrought such misery among the people and caused such weakness in the governments of Europe, and which had afflicted France with special virulence. Oresme's treatment of the principles of coinage and seigniorage is characterised by great precision. At the beginning of the 16th century, the astronomer COPERNICUS addressed to the king of Poland his treatise *Monetæ Cudendæ Ratio*, which deals with the then universal evil of the corruption and debasement of coin. But it was Italy which made the largest of the earlier contributions to the philosophy of the subject. Mr. Stephen COLWELL remarks that this country was long noted for the worst money and the best writers on money. The coin of Italy was sunk into an abyss of discredit while BECCARIA and VERRI were expounding the true laws of monetary circulation, and the works of SCARUFFI and NERI were manuals for the mints of the continent. Among the early English writers on money, say from 1682 to 1717, the most distinguished names are those of Sir Wm. PETTY, Dudley NORTH, John LOCKE, William LOWNDES, John LAW, and Sir Isaac NEWTON. In 1730 SWIFT published his *Drapier's Letters*, concerning Wood's brass halfpence, more notable as an example of satire and invective than as a contribution to the theory of money. Shortly before the publication of Adam SMITH'S *Wealth of Nations*, Sir James STEUART'S *Enquiry into the Principles of Political Economy* dealt at length with the problem of money; and the same writer, acting for the East India Company, in 1772 wrote his treatise on the coin of Bengal. HARRIS'S essay upon money and coins (1757), belonging to this period, contains matter of historical interest. Adam SMITH'S great work (1776) did not add much to the philosophy of money. His compatriot and contemporary, David HUME, on the other hand, though in brief compass, made a contribution of no little value. The suspension of specie payments by the bank in 1797, and the long controversy which followed the bullion report of 1810, gave rise to an immense volume of literature, much of it of permanent value. The tracts and other publications of Lord KING, Sir Francis BARING, R. TORRENS, BOSANQUET, Boyd, MUSHET, Hill, VANSITTART, Foublanque, General Craufurd, Lord LAUDERDALE, William BLAKE, Arthur YOUNG, William HUSKISSON, Francis HORNER, David RICARDO, and Henry THORNTON, are deserving the attention of every student of monetary science. The giants of this controversy were the last four. Ricardo's tracts on money perhaps occupy the highest single place in the literature of the subject. Lord LIVERPOOL'S treatise on the *Coins of the Realm* (1805) derives its chief interest from its relation to the demonetisation of silver by the English government, in 1816. Thomas and Matthias ATTWOOD were the champions of FIAT MONEY. Following the resumption of specie payments, in 1819, there came within a few years Sir Walter Scott's letters on the currency of Scotland (Malachi Malagrowther); Sir James GRAHAM'S *Coin and Currency;* Sir Henry PARNELL'S *Observations on Paper Money, Banking, and Overtrading;* SENIOR'S *Cost of Obtaining Money;* JACOB'S *Inquiry into the Production and Consumption of the Precious Metals;* and, greatest of all, Thomas TOOKE'S *Inquiry into the Currency Principle*, 1844. Tooke assumed and strongly fortified the positions regarding the operation and influence of paper money, which he afterwards assaulted with such distinguished ability in his *History of Prices*. Belonging to the next period, that, namely, between 1832 and the time of the Australia and California gold discoveries, are Poulett SCROPE'S *Examination*, etc., FULLARTON'S valuable work on *The Regulation of Currencies*, and James WILSON'S *Capital, Currency, and Banking*. Most of the economic interest of this period centred in the action of parliament regarding the Bank of England; and the report on the bank charter, in 1833, from the secret committee; and the first and second reports of the select committee upon banks of issue, 1840 and 1841, are among the most valuable blue books issued since the bullion report of 1810. Peel's act of 1844, regulating the privilege of issue, gave rise to an enormous literature. Chief among the disputants were Thomas Tooke, Lord Overstone (Samuel Jones LOYD), Colonel TORRENS, George Warde NORMAN, James W. GILBART. The chapters regarding money in Mr. Mill's great work on political economy are among the most important contributions of this time to the theory of that subject. The Californian and Australian discoveries, about 1850, produced several works of marked value, particularly William NEWMARCH'S *New Supplies of Gold*, and J. E. CAIRNES'S *Essays on the Gold Question*. Maclaren's *History of the Currency* may be mentioned. The demonetisation of silver by Germany, following the American Civil War, produced a controversial literature rarely equalled. The same period has also witnessed the publication of some important constructive works, pre-eminently Mr. BAGEHOT'S *Lombard St.*, Prof. JEVONS'S *Money and the Mechanism of Exchange*, and Mr. Goschen's *Foreign Exchanges*. Mr. Ernest SEYD published several pamphlets in favour of bi-metallism early in the course of the controversy; Mr. H. Hucks Gibbs (now Lord Aldenham), Prof. H. S. Foxwell, and Prof. J. Shield Nicholson have led in the recent discussion on the same side; while Sir Robert Giffen and Lord Farrer have upheld monometallism. The report of the commons committee of 1876, on the depreciation of silver, is of great importance.

In the United States, money or "currency" (Mr. M'Leod calls this word "a mischievous Yankeeism") has always been a favourite theme. Pelatiah WEBSTER'S *Nature and Operation of Money* (1792) is interesting and valuable. Prof. W. G. Sumner's *History of American Currency* presents much information. Accounts of the paper money issues of the several colonies have been written by FELT, PHILLIPS, Brownson, and others; and of the revolutionary paper money by J. W. Shuckers. The works of Alexander HAMILTON, Albert GALLATIN, and Daniel WEBSTER, contain much that is of value in the theory of money. Messrs. Condy Raguet and Wm. M.

Gouge were among the passionate opponents of bank money. Prof. George Tucker's *Money and Banks* is a work of merit. Stephen Colwell's *Ways and Means of Payment* contains much useful information. The theory of bank money is treated with great fulness in Prof. Amasa Walker's *Science of Wealth*. The "inflation period," 1862 to 1879, brought on extended discussions of inconvertible paper money, in which the leading participants were Henry C. Carey and H. C. Baird on the Fiat Money side; and David A. Wells and W. G. Sumner on the Hard Money side. Mr. John J. Knox's work, *United States Notes*, furnishes the most accurate account existing of the national issue of paper money. H. R. Linderman's *Money and Legal Tender* is a useful manual. Francis A. Walker's large treatise on money was published in 1878; and his smaller work, *Money, Trade, and Industry*, in 1879. Mr. S. Dana Horton is easily the most learned of the writers in favour of bi-metallism (see his *Silver Pound* and *Silver in Europe*); Prof. J. Laurence Laughlin's *Bi-metallism in the United States* is strongly monometallist in its bearings.

In France, the treatise of M. Chevalier, *La Monnaie*, the third volume of his "Cours d'Économie Politique," has held a pre-eminent place. During the first flood of the new gold, Chevalier wrote a work on the *Probable Fall in the Value of Gold*, which was translated into English by Richard Cobden. The proceedings of the *Enquête Monétaire* of 1870 are of great interest. Courcelle-Seneuil's *Opérations de Banque* is a leading work. Léon Faucher's small treatise on the *Production of the Precious Metals* is a work of merit. Louis Wolowski's writings on money in general, and particularly those in favour of bi-metallism, hold a high rank. The most energetic advocate of bi-metallism is M. Cernuschi, whose special antagonist for many years was M. Feer-Herzog of Switzerland. M. Esquirol de Parieu and M. Levasseur take the monometallist side. F. Lenormant's essay upon the money of ancient nations is of permanent value. The reports of the conference of the Latin union (France, Switzerland, Italy, and Belgium), and those of the international Monetary Conferences of 1867, 1878, 1881, and 1892, are of great value. Other writers on money who should be mentioned in any bibliography, however short, are Emile de Laveleye of Belgium, Prof. Léon Walras of Lausanne, Vrolik and Mees of Holland, and N. P. van den Berg of Batavia, now Governor of the Bank of Holland. William Roscher's treatise on money (translated into French by Wolowski), and Knies' *Das Geld* are perhaps the most important German works on this subject. Philip Geyer's *Theorie und Praxis des Zettelbankwesens* may also be mentioned. Bamberger's *Reichsgeld* and other writings are among the ablest extant upon the mono-metallic side. A. Soetbeer's investigations into the production of the precious metals are of high value. Prof. Miklashewsky, *Study of the chief positions of the classical theory in regard to the question of money* (Moscow), 1895. Leroy-Beaulieu, *Écon. Pol.*, 1896, vol. iii.] F. A. W.

The National Monetary Commission, United States Senate, of 1908 (N. W. Aldrich, *Chairman*, A. Piatt Andrew, *Special Assistant*) has made a very large collection of works on the subject.

MONEY (Quantity Theory). See the Quantity Theory of Money.

MONEY OF ACCOUNT. The "money of account," or the terms in which values are recorded, is, in modern monetary systems, generally the same as the standard of value of the country in which the accounts are kept; the metallic and note currency being reckoned in the same measure, while values less than that of the standard are expressed decimally. Thus, in the states of the "Latin Monetary Union" (France, Belgium, Italy, Switzerland, and Greece) accounts are kept in francs, in Germany in marks, in Scandinavia in crowns, and so forth. The money of account in Great Britain differs from that of the majority of modern states from the fact that, although large sums are recorded in pounds, values smaller than that of the standard are expressed in shillings, pence, and farthings, instead of in decimal parts of a pound. Though, as simplifying and facilitating commercial transactions, it is desirable that the money of account should be identical with the standard of value, this is by no means essential to the practical working of a monetary system. Neither is it necessary that the terms in which values are accounted should be represented by an actual coin in the circulation of the country. In England, for instance, when the shilling was the money of account, there were many years during which the only coins in use were silver pence, while at the same time the standard of value was a pound troy of silver of the millesimal fineness of 925.

Similar examples of complex systems of currency and account are to be met with. Several such instances occurring in the early history of the British colonies are recorded by Mr. Chalmers in his *History of Currency in the British Colonies*, 1893, an interesting case being that of the Leeward Islands. In the 17th and 18th centuries the standard of value in this colony was a commodity known as "Muscovado sugar"; this article being also the principal medium of exchange. Accounts were, however, kept in sterling terms, and we learn that, by an Act passed in the year 1700, ratings of commodities in sterling, for purposes of account, were fixed as follows:

12s. 6d.	current money	for every	100 lbs.	of Muscovado
2s.	"	"	1	" Indico
9d.	"	"	1	" Cotton wool ginn'd.
1½d.	"	"	1	" Tobacco or ginger.

In Newfoundland, until so recently as 1887, when an Act consolidating and amending the currency legislation of the colony was passed, a money of account known as "Halifax currency" was in use. The ratings of coin in circulation under this system of account were fixed by an Act of the Assembly of the island passed in 1845, and were as follows:

	£	s.	d.	
Doubloon	3	16	9⅔	currency
Sovereign	1	4	0	"
Crown		6	0	"
Dollar		5	0	"
Shilling		1	2⅔	"

[See also Ideal Money.] F. E. A.

MONEY MARKET. A term applied to an organisation which has always existed in a more or less developed form in countries where wealth has had time to accumulate. Only its modern characteristics can be dealt with here, and the examination thereof must be confined to London, the largest and most highly organised example of the species.

The London money market consists of—(*a*) the Bank of England; (*b*) the joint-stock banks; and (*c*) one or two powerful private banks, the discount houses and bill brokers; (*d*) the

large mercantile houses who have money to lend from time to time; and (*e*) the Stock Exchange. As a rule the term "the market" is employed to denote classes (*b*) and (*c*) alone, the Bank being regarded as outside "the market," meaning the market for bills, while (*d*) and (*e*) are similarly excluded because their operations are of an intermittent character, and in the case of (*e*) are, as a rule, "all one way," the Stock Exchange being more of a customer for dealers in money than a dealer in money itself. There are, however, certain wealthy stock exchange firms who are really dealers in money, and not infrequently lend their surplus balances in Lombard Street. The great merchant houses are often very large lenders, through their possessing temporary control of considerable sums of money derived from loans, subscriptions to loans, remittances from foreign governments, and in other ways; and, on the other hand, they often take money out of the market by discounting bills or selling stock. They are, therefore, like the Stock Exchange, too closely allied to "the market" in the narrow sense of the term to be omitted from the list of elements making up the real market.

(*a*) The Bank of England.—Thirty years or more ago the Bank was an integral part of the London money market, possessing a power which it has not now. Formerly it had considerable influence on the discount rate, being a considerable holder of bills, but for many years past it has ceased to compete for bills with the great joint-stock banks, two of which have so large a share of this class of business that they practically control the discount rate on any day on which they are both buyers, or both "hold off" from the market. The Bank rate of discount has ceased to be any indication of the real discount rate in London, except very occasionally. This is not a satisfactory state of things, as the loss of control over the discount rate has involved the loss of power to influence the foreign exchanges, a power which is needed by the Bank in order to enable it to protect its reserve, which is the sole cash reserve of all the banks in the United Kingdom. The Bank has never explicitly admitted its responsibility for the reserve, but it does admit it implicitly. On the other hand, the banks ostensibly deny that they have any responsibility in the matter, but there is good reason for believing that they recognise it in practice, and will help the Bank to maintain a proper reserve should the course of events again place it in danger.

(*b*) The magnitude of their deposits gives the great joint-stock banks vast power in the money market. The National Provincial Bank of England and the London County and Westminster together hold over £144,000,000 of deposits, and the Union of London and Smiths and Lloyd's, both largely country banks with important offices in London, hold about £124,000,000 more. The National Provincial and the London County and Westminster are among the largest holders of bills in the market, and, as already observed, the rate of discount for the day usually depends on their operations. The banks meet from time to time to arrange what rate shall be allowed on deposits.

(*c*) The discount houses and bill brokers are also large buyers of bills, but they are not such "firm" holders of them as the banks. The smaller brokers, indeed, hold very few bills, though their turnover is often large, since they act as intermediaries between the great banks and the holders, as creators of bills. Strictly speaking they are not competitors for bills, but they provide the machinery by means of which the banks compete for them. The larger brokers and the discount houses are competitors of the banks, and hold considerable amounts of bills, which, however, they are quite ready to "turn out" at a profit, while banks, in nearly all cases, hold the bills until maturity. The bill brokers and discount houses work largely with money borrowed at call and short notice (seven or fourteen days). They publish the rates they are prepared to allow from time to time, which are usually in harmony with the terms offered to depositors by the banks, but they change their scale more frequently than the banks. Their meetings are of a more or less informal character, and changes are rarely made by any individual house alone, even when strong views as to the expediency of the proposed movement are taken by it. The brokers have a large area to borrow from. They obtain most of what they use from banks, but are also in close touch with the stock exchange money brokers, lending to them and taking money from them on consols and other high-class securities; and they have the Bank of England to rely upon in the last resort, though recourse to that institution is surrounded with restrictions, regarding the policy of which much difference of opinion exists.

The working of the Money Market.—Under normal conditions the London money market works very smoothly. Bills to a very large amount fall due every day and are paid; the "money" is reinvested in other bills, or if these cannot be secured on satisfactory terms, the "money" is lent in the short loan market on bills or stock, for periods which may vary from one day to a fortnight; or the "money" may be employed on the stock exchange either as a monthly loan on consols or until the "next account," which usually means about a fortnight. One great bank almost invariably reinvests money obtained from the payment of bills falling due daily in other bills, but most banks allow themselves a certain latitude in this respect, and the bill brokers have many more bills in their cases at some times than at

others, though they always try to keep up a certain average. In normal times all money in the hands of the market is lent up to the last penny, at some rate, by about 4 P.M. if possible. If nothing else can be done with it, it is lent "for the night," often at a rate which seems hardly worth accepting. Sometimes, for instance in 1894-96, money is very abundant for a long time. The high prices which rule during such periods for all the best investments, including bills, and the low prices of commodities and slackness of trade, have the effect of making money redundant in the market, except for brief intervals. There is then no disposition to invest capital for long periods, or to "lock it up" in industrial occupations. All who possess or have the control of loanable capital prefer, at such times, to keep it in a form as easily convertible into cash as possible, in order that when an opportunity occurs for profitable investment, advantage may at once be taken of it. When a revival of trade has begun, and the prices of commodities have risen, a change takes place in the attitude of the controllers of wealth. They find that more money is wanted to do a given amount of business than before, and that there is more business to do. The surplus money disappears from the market, and lenders have less difficulty in "placing" such surplus balances as they have on hand. When once this process has begun, it usually leads to a state of things the exact opposite of that we have been discussing; not only is all available money eagerly borrowed, but credit is stretched to the utmost. A great deal is invariably lent to the wrong people and on wrong securities, and finally a collapse of a more or less serious character occurs in credit. At such times the only quarter whence loans can be obtained is the Bank of England, as all other institutions have employed their resources to the utmost. On two occasions prior to 1866 the pressure on the bank was so great that the chancellor of the exchequer had to allow the bank to suspend the act of 1844, which restricts the note issue (see PEEL, Sir R.). The way in which the lock-up of capital in unsaleable securities, or securities on which loans cannot be obtained, comes into existence, may be very different at different times (see articles on CRISES).

The "money," or more properly the "loanable capital" with which the money market deals, is of a peculiar kind. It may be defined as wealth in its least specialised form, a form it can only assume in a very rich country, where all the specialised forms of wealth, but more particularly those which are easily exchangeable for other kinds of wealth, such as gold and high class securities, are very plentiful. All countries which have developed the modern form of civilisation possess a certain amount of "money-market money," but in all but a few it is of small amount. The supply of it in this country is enormous, but not unlimited, as events have more than once shown. Credit is based on this almost impalpable form of wealth, and when it has been exhausted by an excessive granting of credit, the fabric of credit breaks up. In the London money market, the organisation by which, to use a physiological analogy, non-specialised wealth is "secreted" and accumulated, is more effective than in any other at present known. This is owing to the fact that savings are almost universally deposited in banks, and that we possess a "one reserve system," as BAGEHOT called it, whereby the Bank of England has become the sole depository of the reserves of the banks of the United Kingdom. The system is not without disadvantages, but it is highly economical, and it appears likely to continue.

H.

MONEY BILL (in Parliament). A "money bill" is a bill which seeks either to impose taxation or to allocate public moneys to some particular purpose. By constitutional usage such bills must originate in the House of Commons on the initiation of the government of the day. The resolution overthrowing the introduction of the bill must be passed in committee of the whole House (standing order 58). The House of Lords may reject, but cannot amend a money bill.

Where a bill is not a money bill, but incidentally involves the grant of public money, the grant must be passed by a committee of the whole house, and adopted on report before the clause which deals with the grant can be considered in committee on the bill.

The object of these provisions is, first to preserve the control of the elective branch of the legislature over all matters of supply, and secondly, to safeguard the public purse from unexpected attacks on it by private members.

[Anson, *Law and Custom of the Constitution*, vol. i. pp. 252-257.] M. D. C.

MONEYS TO BE PROVIDED BY PARLIAMENT. This is a technical phrase used in drafting acts of parliament. When the expenditure of public money is authorised, and it is intended that the expenditure shall not be charged on the permanent consolidated fund, but shall be voted annually in committee of supply, the act provides that the expenditure in question shall be defrayed "out of moneys to be provided by parliament." M. D. C.

MONEYERS may be called the manufacturers of coin, every mint having one or more

in charge of it, with, except perhaps in the earliest periods, subordinate workers under them. After Norman times they were no longer the sole officers of the London mint, but were assisted on the one hand and checked on the other by a growing staff of officials with separate duties. From the first, the responsibility of their office was recognised by the laws regarding them, and especially by the heavy penalties, such as the loss of a hand, which were enacted not only against false moneyers who counterfeited the coin, but against the authorised moneyers if guilty of any offence in the exercise of their office. The practice, found as early as the Anglo-Saxon period, of stamping on the coin, usually on the reverse, the name of the moneyer from whose mint it was issued, was probably intended as a check on irregularities, the more necessary on account of the large number of mints existing in the country.

In early days, when almost all public work was done locally, the mints were most numerous, as is known chiefly from the fact that from the reign of Athelstan (925-940) the name of the town of issue was commonly added to that of the moneyer. He ordered indeed that there should be a moneyer in every burgh, but it is not likely that this law was more than an extension of an already prevalent custom. In London, Canterbury, and Winchester there were at this time eight, seven, and six moneyers respectively. At one time or another there have been more than sixty royal mints in England, three in Wales, and one in Scotland, besides seven episcopal and two monastic mints in England; and this is exclusive of a considerable number of places for which the possession of mints and moneyers has been claimed on doubtful grounds. After Henry III. died 1272, the number of mints greatly declined, and the moneyers' names no longer appeared on the coins; and after Edward VI. died 1553, the mint in the Tower was almost the only one ever used in England except by Charles I. and during the recoinage under William III.

Moneyers seem to have held a position in regard to the king between that of a tenant-in-chief and a Jew, with special liabilities and special protection. They were obliged, if the king visited their town, to coin as much silver as he pleased; they paid relief direct to the king, and he was their heir if they died intestate; they paid an annual rent to the king and a sum of money on every renewal of the coinage for the new dies sent them from the London mint; the moneyers of London were excepted from the privilege granted by Henry II. to the other citizens of not pleading outside the city except in suits with foreigners. On the other hand they received some compensation for their disabilities; they sometimes enjoyed the right of *sac* and *soc* (see SOCAGE), they were sometimes exempted from TALLAGE, and they sometimes lived in a rent-free house. No doubt their business was profitable and was worth the certain payments and the possible penalties.

To preserve the uniformity of the coinage all moneyers had to use the dies supplied from London; even the two archbishops, who in early Anglo-Saxon days had put their own names and effigies on their coins, were obliged after Athelstan to use the royal dies, and later to pay an annual rent to the master of the mint; but they took the profits and at one time were allowed to distinguish their coins by some special mark. After Henry VIII. archiepiscopal coining ceased.

In the 17th century the moneyers of London were paid according to the bullion coined, not by a fixed salary, and their duties are described as follows in the *Report of a Select Committee* of 8th April 1697; "The moneyers draw, cut out, size, blanch, edge, and coin those bars (prepared by the workers) into monies, sissel and broakage back to the masters, by weight; these live in the country, attend the mint whenever called, take apprentices, and form themselves into a government, by electing one of them to be their Provost."

G. P.

MONOMETALLISM. This term is applied to designate a monetary system in which the standard of value consists of one metal, whether of silver as once in Japan, and formerly in Germany, or of gold. Such a system, based upon gold, is found in England to-day. The silver and bronze coins circulating are token currencies, do not contain as much metal as their face-value represents, are regulated in their issue, and limited in their character of legal tender to small amounts—in the case of bronze to 1s., and in that of silver to £2. Gold alone, in the form of coin or of paper convertible into gold on demand, is legal tender without restriction in the payment of debt; and gold alone in the form of bullion is receivable to any amount at the mint, or by the Bank of England as the agent of the mint, and exchangeable for legal tender of the realm. Although, therefore the current media of exchange may consist of bronze and silver for small payments, and of notes and various credit-instruments, such as cheques and bills of exchange, for large payments, and gold may be actually employed in domestic transactions only for payments of intermediate amounts, yet the standard of value is gold alone; for the notes are convertible into gold on demand, and the various credit-instruments are promises to pay, which, according to the regulations of

legal tender, can in the last resort be made only in gold, or in paper convertible into gold on demand. The superstructure of CREDIT (*q.v.*) rests on the foundation of "cash" in the Bank of England; and "cash" consists of gold or paper convertible into gold.

This monometallic system was introduced into England on the resumption of cash payments after the period of the Bank Restriction. The system prevailing before had been one in which silver had formed the unit of account, but gold had been rated to it. Since the abolition of seigniorage charges in 1666, with the exception of a brief interval during the recoinage under William the Third, when the importation of gold guineas was prohibited for a few months to allow of the successful accomplishment of the necessary operations, and, at a later time, of the suspension of the free coinage of silver in 1798, the mint was freely open to the unrestricted coinage of both silver and gold, and both metals were indifferently regarded as unlimited legal tender in the payment of debt. In 1774 the tender of silver by tale was indeed restricted to £25, but it was apparently allowed to be tendered by weight without restriction. Between the recoinage under Elizabeth and that under William the Third, the silver remained unaltered in intrinsic value, but the gold was changed some four times. At the time of the later recoinage the current gold coin was the guinea, which nominally passed at twenty shillings. Owing to a deteriorated condition, due partly to wear and tear, partly to deliberate clipping and sweating, and partly to constant exportation of the heavier and better coins, the silver—of which the unit of account was the pound, but the coins actually current were for lower denominations—fell in value so rapidly that the guinea rose to thirty shillings. The question then presented itself, whether the silver should be reinstated in its former position, or the change in its value recognised and stereotyped in the new coinage. It was determined to restore the Elizabethan standard, and by successive stages the rating of the guinea was reduced. But, both before and after the recoinage, the silver was under-rated and the gold over-rated, in comparison with the rating which prevailed in other countries, and the increasing production of gold in the 18th century gave an added force to the natural consequences of this act. In accordance with the operation of GRESHAM'S LAW (*q.v.*) the over-rated metal found its way to the mint in increasing quantities, and the under-rated metal left the country; and, when a new recoinage was effected in 1774, the gold had taken the preponderant place in the currency, and its deteriorated condition demanded the chief notice, while the restriction mentioned above of the legal tender of silver by tale to sums of less than £25 seems to have been due to the existence of a large quantity of light silver which had taken the place of the heavier coins sent abroad. The recoinage was followed in 1798 by the suspension of the free coinage of silver; and, at the resumption of cash payments, gold was formally adopted as the standard, a heavy seigniorage was charged on the coinage of silver, its reception at the mint was definitely stated to be no longer free, and its character of legal tender was limited to sums no greater than £2. These changes were carried into effect by the younger Lord LIVERPOOL, but were in general agreement with the principles advocated by his father in the well-known *Treatise on the Coins of the Realm*. In some respects, indeed, they appear to have gone beyond the alterations recommended in that treatise, especially with regard to the seigniorage on silver. The elder Lord LIVERPOOL does not seem to have contemplated a charge exceeding the cost of coinage, which is technically known as BRASSAGE (*q.v.*), but it is probable that the heavier charge was prompted by a desire to meet the inevitable expense attendant on the resumption of cash payments.

The history, which has been given in brief, of the original adoption of the monometallic gold standard in England, has acquired considerable importance in later discussions on the merits of the system. It is urged by critics of monometallism that its introduction was accidental, that it conflicted, not only with previous practice, but also in reality, though not in appearance, with the theory of the older monetary authorities, and that it was made without a full appreciation of its possible results. On the other hand, the supporters of the system maintain that the Legislature merely endorsed by its sanction the informal and spontaneous choice of the people, that great inconvenience had arisen from the previous system, that the chief monetary reformers had repeatedly urged the adoption of the principles on which monometallism was founded, and that it was deliberately introduced to secure advantages which subsequent experience has shown to be inherent in it. These different views appear sharply antagonistic; but the difference turns to a considerable extent on the particular interpretation placed on certain words and actions, which admit of different meanings. There seems, for instance, little doubt that before the resumption of cash payments the currency had become preponderantly gold, and that a change in that direction had been evident throughout the 18th century. It is contended that this change was due, not to the deliberate preference of the people, but to an accident occasioned by over-rating of the gold and under-rating of the silver; and it

is urged that, at the time of the suspension of the free coinage of the latter metal, the conditions of production were altering in such a way that, had there been no such suspension, the currency would have become preponderantly silver. In a similar way different interpretations have been put on language used by PETTY and LOCKE, by NEWTON and by Adam SMITH (*q.v.*). They speak of one metal as the only possible "standard"; "one metal," says Locke, "alone can be the money of account and contract"; but the reformers of William the Third in thus speaking seem to have had especially before them the desirability of maintaining the Elizabethan standard for the silver pound, and they were fully aware that the gold was rated to it. They recognised a system under which both metals were freely received at the mint, and were indifferently legal tender in the payment of debt. They expressly urged the desirability of making the English rating accord with that prevailing abroad; and it was because their advice was followed imperfectly that the currency became preponderantly gold. Nor can there be doubt that the depletion of the silver was a real inconvenience; and that it was met successfully by the provisions for token coinage made at the introduction of the gold standard.

For the purpose of a convenient *internal* currency, regarded from the point of view of the media of exchange, such a monometallic system as that introduced into England at the beginning of the century possesses certain advantages. But the standard so formed is exposed, without any such compensatory action as is found in BIMETALLISM (*q.v.*), to the fluctuations in value of a single metal, whether these fluctuations be due to changes in production, or to alterations in the monetary policy of other countries, such as have characterised the last thirty years. It secures, it is true, a sufficient supply of convenient coins in the shape of tokens for small payments, and effectually prevents their exportation to other countries. Under the older forms of bimetallism, in which it was common for both the standard metals to be turned into coin, disadvantage attached to the use of the cheaper metal, silver, for large payments, as the coins required to settle a transaction of considerable amount were, either individually, or in the total mass, of great bulk, and the definite substitution under the monometallic system of the more valuable metal, gold, obviated this inconvenience. The comparative lightness of the English sovereign and the heaviness and cumbrous size of the French five-franc piece furnish examples of this difference. But now in a country like England coins are chiefly used in domestic trade, either as small change, or as a reserve against the issue of paper and as a basis for the superstructure of credit; and the more recent proposals for bimetallism contemplate the continuance of silver and bronze as token currencies for small denominations, of gold for purposes of change in larger dealings, and of paper money and credit instruments for negotiating still greater payments. In bimetallism, as thus conceived, the two metals would replace the one, in the main, if not exclusively, as a reserve against the issue of paper, and as a basis for the superstructure of credit. They would be freely receivable at the bank in exchange for legal tender, and they would indifferently form the basis of it. So far as the *domestic* trade of the country was concerned, it might, it is contended, be carried on as it is at present under our monometallic system.

With regard to *international* transactions, which would thus be chiefly affected by the adoption of bimetallism or monometallism, opposing arguments have been advanced by the supporters of either system. The use of a single standard is considered to attract business, at any rate of a financial nature, to the country where it is established, because every one knows precisely the mode in which he will be called upon to discharge his obligations to others, or will find that others meet their obligations to him. In London, for instance, it is contended, you are now always paid in gold, and pay in gold. Under a bimetallic system you might be paid in gold or silver, at the option of the debtor; and you yourself might pay in either metal as you preferred. This possibility, it is maintained, would not merely give rise to the inconvenience of being compelled on occasions to deal in international transactions with a bulkier instead of a lighter metal, but it would generate an uncertainty which would tend to drive away the business now attracted to London by the plain and recognised interpretation given there to monetary bargains.

On the other hand, monometallism, unless universally based on the same metal, fails to provide a par of international exchange. At present advanced nations appear, unless the tendencies of national policy are reversed by international action, to be likely to adopt and retain finally a gold standard. The example of England was followed by Germany at the conclusion of the Franco-German War, and Holland and the Scandinavian States imitated the action of Germany. The United States returned to specie payments on a gold basis after the civil war; in 1873, the LATIN UNION suspended the free coinage of silver, and adopted what has been distinguished as a limping or halting bimetallism, while Austro-Hungary, Japan, and Mexico have since established gold monometallism. For China a silver monometallic basis has been proposed to be kept by some method, not yet explained, on a level with gold. It should be added,

that some writers think that, were it feasible, silver alone would form a better standard for the world than gold. Experience has shown that it is more stable in value; and high authority (*e.g.* that of RICARDO), can be cited in its favour.

To these arguments monometallists answer that the difficulties of exchange between gold and silver-using countries have been exaggerated. There are, in short, they contend, no circumstances which would warrant the serious step of changing a monetary system, recommended not merely by its intrinsic merits—its simplicity and its convenience, and its freedom from international entanglement—but also by familiarity due to long establishment. A change in such a system would occasion a panic, or at least create confusion; and on negative and on positive grounds alike it is maintained that monometallism is the better system. Such contentions are not of course admitted by bimetallists (see BIMETALLISM); but they are confidently advanced.

[For the literature of the subject see the references under BIMETALLISM. For the history of the introduction of gold monometallism into England, Sir R. H. Inglis Palgrave's Memorandum contained in the *Third Report of the Depression of Trade Commission* should be consulted, and also Mr. Dana Horton's writings, especially his *Silver Pound*, Mr. W. A. Shaw's *History of Currency*, and Lord Aldenham's *Colloquy on Currency*. Lord Liverpool's *Treatise on the Coins of the Realm* shows what considerations had weight with the authors of the change; and the reports of the debates in parliament at the time of the resumption of cash payments should be consulted. The evidence before the *Gold and Silver Commission*, together with the final report of the Commission, supplies an authoritative account of the arguments advanced by supporters and opponents of monometallism; and the evidence given before the *Commission on Agriculture* by Sir Robert Giffen and Lord Farrer, and by Professor Foxwell and Mr. Everett, should be referred to for a more recent statement of the case. The *Report of the Brussels International Monetary Conference* should also be consulted. Sir Robert Giffen's *Case against Bimetallism* on the one side, and Professor Nicholson's *Money and Monetary Problems* and Wilkie's *International Bimetallism* on the other contain discussions of various important aspects of the question. Professor Taussig's *Silver Situation in the United States;* M. de Boissevain's *The Monetary Question;* Mr. E. Helm's *Joint Standard*, and Professor Foxwell's articles and pamphlets should also be studied, and the publications of the Gold Standard Defence Association and of the Bimetallic League, which are authoritative, although avowedly controversial. JEVONS's *Investigations in Currency and Finance*, and also his *Money and the Mechanism of Exchange;* General WALKER'S *Money*, and also his *Money, Trade, and Industry*, and Professor SIDGWICK'S *Principles of Political Economy*, may be consulted for a more general and theoretical treatment of the question.] L. L. P.

MONOPOLIES. The issue of letters patent, granting the recipients the exclusive right of dealing in particular commodities or pursuing a particular trade, began long before the time of the Tudors, but it was only under them that monopolies began to be a serious abuse, and it was not till near the end of Elizabeth's reign that they became a real grievance. The subject came under discussion in parliament in 1601, when Mr. Laurence Hide on 20th November brought in a bill entitled "An Act for the explanation of the Common Law in certain cases of Letters Patent." The list of monopolies read on this occasion included such things as salt, currants, iron, playing cards, carriage of leather, ashes, bottles, vinegar, coals, etc. The salt monopoly is said to have raised the price from 16d. to 14s. or 15s. a bushel. Discussion on this occasion was stopped by a message from the queen, who promised to revoke all objectionable patents and grant no more. James I. on his accession issued a proclamation suspending all existing monopolies till the council should decide that they were not prejudicial to his subjects, but before the end of his reign they were being granted as freely as they had been by his predecessor. Matters were brought to a crisis by the action of the Purveyors (see PURVEYANCE), of whom Giles Mompesson (afterwards Sir Giles) was the most notorious. He originated a scheme by which the licensing of inns and ale-houses, then as now, under the justices, should be subject to the approval of two commissioners, himself and another, appointed by letters patent. The enormous bribes and fees exacted by these commissioners enraged the people, already excited about the general question of monoplies; the matter was taken up in parliament in the spring of 1621, Mompesson fled to the continent, and on the 31st March the monopoly bill passed the Commons, the three most obnoxious patents, those for inns, gold wire, and concealed lands, having meanwhile been cancelled by proclamation. In 1624 the monopoly bill passed the Lords. By it all monopolies, except the protection of inventions for twenty-one years, were declared illegal, the decision in any case being put into the hands of the judges. The exemption from its action of corporations, an exemption made on behalf of the great trading companies, the Levant Company and the like, was destined to give trouble in the next reign. In 1631 a company was formed and obtained a patent for making soap of English materials. In the following year it was invested with power to condemn all bad soap, thus obtaining a practical monopoly. A great quarrel ensued between the company and private manufacturers, which lasted several years and was of great political importance. In 1634 similar companies obtained monopolies for salt, shipping of coal, malt, and starch, and others were formed in

succeeding years till 1639, when most of the patents were revoked by proclamation. Then followed the civil war which put an end to the question of monopolies as it did to so many other vexed questions of royal prerogative.

[See *The Great Case of Monopolies*, and Lord Coke's remarks on it.—Hallam, *Constitutional History of England*.—Prothero, *Statutes and Constitutional Documents*, Cambridge, 1894.—Hume, *History of England*.—Gardiner, *History of England*, London, 1888.] A. E. S.

MONOPOLIES IN THE UNITED STATES. In the United States, aside from copyright and trade marks, there are no legal monopolies of consequence excepting the patent right. The patent right secures to the owner and his assigns the monopoly of the manufacture and sale of the patented article for seventeen years.

In certain isolated cases the state itself has owned and managed, either directly or by lease, certain industries, as, for example, the salt industry in the state of New York until the year 1894; but such cases are so rare that they are not worthy of detailed consideration.

The so-called "natural monopolies," meaning thereby the railroads, telegraphs, telephones, waterworks, gas and electric lighting plants, etc., in the United States, are ordinarily in private hands, under the more or less careful supervision of the state authorities. At the beginning of the era of railroad building there was no thought on the part of the citizens of a necessity for restricting railroads in their privileges; and in earlier years what laws were passed were either directly for the encouragement of the railroads, by means of grants of lands or guarantees of loans, or else they were general laws permitting any responsible corporation to undertake the building of a railroad in whatever locality it thought desirable, the power of EMINENT DOMAIN for compulsory purchase of private lands being granted freely. Within a few years later, however, especially after the smaller roads first built began to combine into longer through routes, the necessity of some restriction made itself felt. At first in New Hampshire, and soon afterwards in certain other states, temporary commissions were appointed to investigate the causes of accidents, and to recommend or, if necessary, prescribe certain regulations to prevent similar misfortunes in the future. In the years from 1850 to 1870, however, the roads had become so powerful and had made their influence so strongly felt through their discriminations in rates between different localities, and especially, as it was thought by the farming classes, through their exorbitant freight rates, that much hostile feeling was aroused. In the states of Illinois, Wisconsin, and Iowa especially, laws were passed prescribing strictly the rates of traffic, as well as restricting the freedom of administration in many other ways. These somewhat arbitrary laws were found to be so stringent that it was necessary to repeal some of them within two years. But the feeling against the railroads still existed, and careful control of them was attempted in other ways. In the eastern states, following the lead of Massachusetts, railroad commissions were appointed, with powers of investigating in detail the business of the roads, with the duty of advising the railroad managers, and with instructions to report annually to the legislature the conditions found, but with no power to enforce their decisions; it being hoped that the pressure of public opinion would be sufficient to secure just action on the part of the roads. In several other states, following the lead of Illinois, commissions were appointed with power not merely to advise the roads but to prescribe specific rates for freight and passenger traffic, to insist that sufficient facilities for handling traffic be provided, to make classifications of freight and passenger traffic, to regulate connections between trains, etc., and, through the courts, to enforce their decisions.

This method of control by the legislatures has spread from state to state until at present twenty-two states have railroad commissions for the control of the traffic that is carried on within the state.

Inasmuch, however, as a large part of the traffic is interstate, and inasmuch as under the United States constitution interstate commerce is under the control of the United States, it was found necessary to establish in 1887 the interstate commerce commission, a board consisting of five members appointed by the President, whose duty it should be to have the oversight of interstate commerce as the state commissions have of commerce within the separate states (see INTERSTATE COMMERCE LAW, U.S.A.). The powers of the commission are in the main those given to the commission of the state of Illinois. Under certain general rules laid down by the statute, the commission is empowered to prescribe reasonable rates, to take cognisance in a judicial way of complaints made of violation of the law, and to make rulings regarding them, the power of enforcement, however, being in the hands of the United States courts.

While, as yet, neither the state commissions nor the interstate commerce commission have been able to prevent all abuses, the law being frequently evaded, especially as regards discrimination in rates between different shippers, it is nevertheless true that these abuses, under the careful oversight of the commissions, are becoming rapidly less. The commissions are greatly extending their power, they are acting harmoniously one with the other, and there can be little question that they will be able in the future gradually to assume a more strict control of the railroads than has been the case heretofore.

In the United States the telegraphs are in the hands of private corporations. Earlier there were many competing companies, most of which, however, were gradually absorbed by the more powerful ones, until at present (1895) only two of consequence remain: the Western Union Telegraph Company, which controls from 85 to 90 per cent of the lines throughout the country, and the Postal Telegraph Company which controls the remainder.

Within the municipalities it is customary for the waterworks to be owned and managed by the municipality, though there are of course very many exceptions. Until within a very few years the gasworks were all owned by private corporations, but recently several cities —some twelve or fifteen—have obtained control of their gas and electric lighting plants. The only large city, however, which owns its own gasworks is Philadelphia. The tendency at present is clearly toward public ownership and management of the lighting facilities in the cities. The telephones in the United States are owned entirely by private corporations, most of them by the Bell Telephone Company, though, since the expiration of some of its patents within the last year, several rival companies have been started.

Of chief significance, however, in the United States are those monopolies which may be called capitalistic monopolies, the industries that become monopolies simply through the advantages that come from the use of large capital. The first great monopoly of this class was the Standard Oil Company, which, through a process of rapid growth through ten or fifteen years, with the advantages of lower freight rates on the railroads than its rivals could secure, finally, in 1882, was organised into the Standard Oil Trust, a combination that was able to control 85 per cent of the total output of refined petroleum in the country. For many years the business of the trust was confined entirely to the refining industry, the petroleum fields and raw petroleum being in the hands of other companies; but of late years one of the largest and most important of the petroleum fields has fallen into the hands of the Standard Company. The other most important capitalistic monopolies are the American Sugar Refining Company (Sugar Trust), the Distilling and Cattle Feeding Company (Whisky Trust); with several other large ones, especially the combinations controlling cotton-seed oil, linseed oil, white lead, dressed meat, cordage, and tobacco. In very many other industries, however, the leading manufacturers and dealers have formed combinations so that over large stretches of territory they have been able to hold almost a complete monopoly, some of the latest books on the subject giving, of the names simply of monopolies, lists that fill eight pages closely printed, and contain the names of some hundreds of distinct monopolistic establishments.

The word trust, as applied to monopolies in the United States, describes simply a form of business organisation. It is really a partnership of corporations. The plan was first devised by the Standard Oil Company, and was afterwards adopted by many others. It consisted, briefly, of an organisation made by a surrender on the part of the stockholders of the different corporations entering into the trust, of their separate shares of stock, to a board of trustees, the trustees holding from the individual stockholders an irrevocable power of attorney. In return the trustees issued trust certificates which represented an equitable share in the combined properties. The business of all the corporations was then managed in unison by the trustees, and the profits of all, being pooled, were distributed among the certificate holders in proportion to their holdings. In this way the interests of the different corporations were made common, the management was made harmonious, and no member, corporation or individual, had it within his power to withdraw from the organisation, as had been done earlier by members of some of the tentative pools that had been organised to prevent competition. Owing to hostile legislation against trusts, many of them have been put back into the corporation form by issuing to each trust-certificate holder a corresponding amount of capital stock in the new corporation, giving him an undivided interest in all establishments represented.

The causes of these industrial monopolies are clearly to be found in the modern form of industrial organisation, in which immense amounts of capital are required. Competition between such great establishments becomes so fierce that often ruin threatens all the rival establishments unless some form of agreement between them is reached. In many instances they have been aided by the railroads, which gave them preferential freight rates, sometimes the tariff laws have helped them.

The results of these monopolies are in part beneficial to society, in part dangerous. (1) A great saving to society is effected by working the best plants in the combination to their full capacity, and stopping the others entirely. (2) All the production in any one line is put under the management of the leading experts in the country. (3) A great organisation with branches in different parts of the country, by supplying its customers from the nearest establishments, is able to save much in transportation, especially in the case of bulky articles. (4) A very large establishment is able to save much in the way of side products that in a small establishment must be wasted. (5) A very great establishment can often afford to keep in its employ inventors and experts whose sole business it is to devise new and improved

methods of production. (6) Through these savings it is possible for the monopolies, while still making a good profit, to lower prices to consumers. A careful study of their influence on prices within the last few years in the United States, however, shows that, while their prices might have been lowered, the monopolies preferred rather to increase their profits, so that the prices have been somewhat higher than formerly under the system of free competition. It has been impossible, however, for the prices to be kept much above the level of competitive prices, on account of the new rivals that were thus called into the field. In the case of the sugar monopoly, for example, the higher prices demanded soon after the organisation of the Sugar Trust, within two years called several powerful rivals into the field, which forced prices down to competitive rates again for some two years, when, these rivals combining with the original trust, it thus obtained control of more than 90 per cent of the refining plants in the country, and again put the prices above competitive rates. Under monopoly, prices are doubtless somewhat steadier than under a system of free competition, but when changes are made in price, they are likely to be made with less warning and to be greater in extent than under a competitive system.

One of the greatest evils in connection with the trusts has been the speculation in their stocks by the managers. Nearly all of the most important of these capitalistic monopolies have been thus dishonestly managed. Again, there is a tendency, on account of the certain market and sure profits, for the managers of monopolies to become less enterprising, inventive, careful in business methods, than those with competitors, though as yet this tendency has not been strongly manifested in the United States. The fact that a much smaller proportion of the men engaged in business in the country are placed upon their own individual responsibility under the monopoly system, will beyond question have a powerful effect upon social conditions and business habits. Beyond doubt too the fact that these large enterprises were likely to be attacked by legislators, and that they also have desired important legislation, at times, in their own interest, has led often to corruption of legislatures and courts.

The danger to the public from these organisations has been so keenly felt that congress and no fewer than eighteen states have passed laws declaring them illegal, and prescribing heavy penalties for their promotion. Several court decisions also declare them illegal under the common law. Nevertheless, under some form they still continue. They are so clearly a product of present industrial conditions and methods that they can hardly be suppressed. Beyond question, the wisest way to deal with them is to control them by inspection and publicity, and possibly by some control over unreasonable prices, as there is in Canada. A commission like a railroad commission could probably control them sufficiently. Their possibilities for good are too many to make it desirable to destroy them.

MONOPOLY means literally sale by one man; but the term is extended to denote either sale, or purchase (*e.g.* of labour), by either one man or a group acting as one man (*e.g.* a trade-union). The definition thus enlarged is usually, or should properly, be limited by the condition that the monopolist deals, not with another monopolist, but with parties who compete against each other. Thus RICARDO (*Political Economy*, ch. vii.): "Commodities are only at a monopoly price . . . when the competition is wholly on one side . . . amongst the buyers." And this limitation is reasonable; for value in "isolated exchange" (Böhm-Bawerk) is not determined by the same laws as in "one-sided competition" (*id.*). Such is the definition here adopted; to the exclusion of a wider sense sanctioned by authority, according to which monopoly exists wherever the number of sellers is not reduced to one, but restricted to a class. It is in this sense that Adam SMITH speaks of "the monopoly of the colonial trade," and CAIRNES and Professor Bastable, of a country having the monopoly of an article, although the traders in the privileged country are not supposed to be in combination. So MILL treats of the "natural monopoly in favour of skilled labourers" (*Pol. Econ.*, bk. ii. ch. xiv. § 2, § 3, par. 1, ch. xv. § 3, last par.); and, in another connection, considers the case of the "sharers in the monopoly" being "numerous" (bk. v. ch. x. § 4). Senior, observing that competition is not free where the concurrence of "an appropriated natural agent" is required, describes the proprietor of such agent as a monopolist. According to him, all landlords are monopolists (*Political Economy*, p. 105); Schäffle designates as *Monopol Verhältnisse*, those advantages which he has treated of as "ausschliessende Verhältnisse." But according

to the view here taken, *Monopoly* does not include RENT and quasi rent.

Monopoly in the sense here adopted plays a greater part in modern economics than has been assigned to it in the classical treatises. Witness the spread of trade unionism, the growth of combination in the new form of trusts, the prevalence of joint-stock companies, particularly railway companies. Mr. Baker estimates that the yearly earnings of all "transportation lines" in the United States, are about one-tenth of the total value of all the year's products. The sphere of monopoly is also being enlarged by the growth of municipal and governmental industries.

The determination of value under monopoly is not so simple as might be supposed from some expressions of classical writers. Thus Adam Smith says: "The price of a monopoly is upon any occasion the highest which can be got" (*Wealth of Nations*, bk. i. ch. vii.); and Ricardo "when a commodity is at a monopoly price, it is at the very highest price at which the consumers are willing to purchase it" (*Political Economy*, ch. vii.). These propositions are true theoretically, upon the hypothesis that the monopolist makes a separate bargain with each buyer. But in practice he must often find a uniform price for all, or at least a whole class of purchasers. The simplest case is where one price is made for the whole market, and the article monopolised is supplied without cost, *e.g.* the water of a "mineral spring" (Cournot). The price is determined by the condition that price × the amount demanded at that price—the product of an ordinate and co-ordinate of the DEMAND CURVES—should be a maximum. The case is less simple, the representation less elegant, when cost of production is incurred by the monopolist, and when he fixes different prices for the same articles sold to different classes (*e.g.* theatre tickets to soldiers and to citizens), or for different articles which have in part JOINT PRODUCTS; such as the carriage of different classes of goods on a railway, the permanent expenses of which are paid out of the rates indiscriminately. The only general principle is to charge on each article "what the traffic will bear."

So far, we have supposed only one monopolist. But when there are two monopolists controlling respectively two factors of production, *e.g.* gas and water power, for which there is a joint demand, the determination of value is more difficult (Marshall, *Principles*, bk. v. ch. xi.), the oppression of the consumer is likely to be greater (COURNOT, *Principes*, ch. ix.).

There are several circumstances which prevent monopoly prices from rising to the full height determined by the preceding theory. The monopolist, for the sake of his own future custom, will not exact the uttermost farthing. Thus American railway companies nurse infant cities, and have even "discriminated" in favour of individuals who are likely to be good customers. Again, the monopolist will refrain from provoking competition by excessive prices. He may be influenced, too, by a regard for public opinion, and even a concern for the interests of the consumer. The last feeling may especially be expected where the monopoly is held by government. In this case, the surplus which the monopolist seeks to maximise will not be simply his own net revenue, but some mean between that surplus and CONSUMERS' RENT, which Prof. Marshall calls *Compromise Benefit* (*Principles*, v. ch. xiv.).

In general, prices under monopoly are higher than they would have been under competition, *other things being equal*. But other things are not equal, for the expenses of production are apt to be less under monopoly, owing (1) to the advantages of production on a large scale; (2) the avoidance of waste incident to competition. Four or five tobacconists in America spend annually in advertising against each other some 3,000,000 dollars (say £600,000), of which two-thirds at least could be saved by combination (Jenks). The balance of forces tending to raise and to lower prices, seems to be against the consumer in the case of some trusts which Prof. Jenks has examined. Even if the price of whisky, or refined sugar, has fallen, it has not fallen as much as might have been expected in view of the fall in the price of the raw material. Nor is the consumer much benefited by the alleged greater steadiness of monopoly prices. The variations in the price of whisky became, after the formation of the trust, less frequent, but more violent.

The injury to consumers is fairly well evidenced. The injustice to producers is even more clearly evident. Mr. Baker estimates that out of 18,000,000 American workers, some 5,500,000 derive benefit from monopolies; that is, about one-third are benefited at the expense of two-thirds. The greater part of the extra gains are concentrated in the hands of a much smaller minority. The high rate of profits enjoyed by trusts may be another evidence of inequitable gains, which it is difficult to obtain owing to the practice of watering stock.

One remedy for these evils is fortunately of comparatively easy application, where the monopoly is a corporation, namely publicity.

[For the definition of monopoly, consult Sidgwick, *Political Economy*, bk. ii. ch. x.; Senior, *Political Economy*, p. 103; and the *Nouveau Dictionnaire de l'Économie Politique*, with the references there given. As to the prevalence of monopoly at present, Foxwell "Monopoles" in the *Revue d'Économie Politique* for 1889; *Parliamentary Papers*, Foreign Office miscellaneous series, No. 174, 1890, c. 5826, 32, Report on Trusts; C. W. Baker, *Monopolies and the People*. other mathematical economists; Hadley, on *Railway Transportation*, and other works relating to railway rates. On the good and evil of modern monopolies, Foxwell and Baker as before; also J. W. Jenks in *Economic Journal*, March 1892; *Political Science Quarterly*, September 1894; Andrews, in *Quarterly Journal of Economics*, January 1889. The most forcible denunciation of monopoly is to be found in classical chapters of the *Wealth of Nations*, bk. iv. ch. vii. pt. iii., and ch. viii.; also bk. v. ch. i. Cp. Mill, *Political Economy*, bk. v. ch. x. § 4.] (See EXCHANGE, VALUE IN; PATENT AND PATENT LAW.) F. Y. E.

MONROE DOCTRINE, the name given to a celebrated declaration of policy made by President Monroe on behalf of the United States. It arose out of two separate complications. The first was the design of the Holy Alliance[1] to give assistance to Spain in her attempts to reduce her revolted South American colonies to submission; and the second was the series of differences between the United States, Great Britain, and Russia with regard to territorial dominion and boundary lines in the north-western parts of North America. Great Britain was strongly opposed to the Holy Alliance, and CANNING, who was then secretary of state for foreign affairs, informed the American government of its intentions, and proposed a joint declaration, setting forth that the two countries were determined to prevent the intervention of any foreign power in the struggle between Spain and her colonies. This project fell through; but it was known that the two English-speaking peoples were prepared to act in concert. Their determination to assist each other in keeping the Holy Alliance out of South and Central America was not affected by their differences with regard to the other matter dealt with by the doctrine under review. Under these circumstances, on 2nd December 1823, President Monroe, in his annual message to congress, declared, *first*, that "the American continents, by the free and independent condition which they have assumed and maintain, are henceforth not to be considered as subjects for future colonisation by any European powers"; and *secondly*, that "we [the United States] should consider any attempt on their [the European powers'] part to extend their system to any portion of this hemisphere as dangerous to our peace and safety. With the existing colonies or dependencies of any European power we have not interfered and shall not interfere. But with the governments who have declared their independence and maintained it, and whose independence we have, on great consideration and on just principles, acknowledged, we could not view any interposition for the purpose of oppressing them, or controlling in any other manner their destiny, by any European power, in any other light than as the manifestation of an unfriendly disposition towards the United States."

These declarations have become a sort of sacred text, and they have shared the fate of other sacred texts in being overloaded with a mass of comments. And, as is usually the case, the commentators may be divided into two classes, those who seek to extend and those who seek to restrict the meaning of the original. The first part of the Monroe doctrine has been taken to forbid the acquisition of any further dominion on the North American continent by European powers (message of President Polk, 2nd December 1845); while the second part was held to justify even a strongly-worded protest against the confederation of the Canadian provinces (resolution of the House of Representatives, 27th March 1867). On the other hand, Mr. R. H. Dana, in his edition of Wheaton's *International Law*, sums up an elaborate examination of the whole subject by the statements that the declaration against colonisation referred only to the acquisition of sovereign title by new and original occupation, and the declaration against European interposition in the affairs of American states was meant to do no more than forbid the extension to the American continent of the system whereby the great powers exercise control over European affairs.

We need not discuss the statement that the American continent is closed against future colonisation. Whatever may have been the case in 1823, it is certain that in 1896 there is no part of the New World which does not belong to a civilised state. Territory in it may, therefore, be acquired by cession or conquest, but not by occupation in that technical sense which signifies the taking and keeping possession of what was at the time of seizure the property of no recognised subject of INTERNATIONAL LAW. The existence of boundary questions does not militate against this view. They presuppose that the districts in dispute are under the rule of some civilised power, the only difficulty being to apportion them among rival claimants.

The really important part of the Monroe doctrine is the assertion of the principle that the state-system of Europe must not be extended to America. Washington, in his farewell address, bequeathed to his countrymen the policy of keeping clear of European entanglements. They accepted the legacy, and soon showed a strong disposition to add to it the corollary that Europe must refrain from meddling in Transatlantic affairs. The circumstances already mentioned brought this clause of their political creed to the front, and it has remained ever since a cardinal principle of the external policy of the United States. Statesmen have differed as to how far it should be carried, but none

1 Formed by Alexander I., emperor of Russia, in 1815; in conjunction with Francis I., emperor of Austria; and Frederick William III., king of Prussia.

have been found to deny it. Successive administrations have acted upon it with more or less of vigour, and the American people support it with practical unanimity. Like most other doctrines the Monroe doctrine has grown with the process of assertion and definition. It has been subject both to healthy development and to unhealthy growth. If we want to know what it is held to cover at any particular time, we must refer to the words and deeds of the American statesmen of that time rather than to the intentions and designs of President Monroe or Mr. John Quincy Adams, his secretary of state. There can be no doubt that in its name the United States would object to the acquisition of fresh territory on the American continent by any European states, whatever were the means employed for obtaining it; and quite recently President Cleveland has argued that it justifies his intervention in the boundary dispute between Great Britain and Venezuela. The United States do, in fact, occupy a position of pre-eminence in the New World very similar to the position of the six great powers in Europe, though they have kept themselves free from pledges to other American states to assist them against European attacks; and they define and defend their hegemony by reference to the Monroe doctrine. That doctrine is not international law; but it is a cardinal principle of American policy, which other powers must take into account if they wish to keep on good terms with the great Transatlantic republic. Indications have not been wanting that the doctrine may develop an economic side, which would in practice tend towards a commercial union of American states.

[Wharton, *International Law Digest*, §§ 57-68. —Dana, note on the "Monroe Doctrine," in his ed. of Wheaton's *International Law*. — Lawrence, *Principles of International Law*, § 136.—*American History Leaflets*, No. 4. President Monroe's message of 1823, containing the statement of the Monroe doctrine, is given in full, in No. 56 of the *Old South Leaflets*, recently published by the directors of the Old South Studies in History, Old South Meeting House, Boston, Mass.]. T. J. L.

MONTAIGNE, Michel de (1533-1592). Although, in his rambling way, the author of the *Essays* touched on innumerable topics, he rather cautiously avoided social and political questions.

"We owe submission and obedience to all kings, for this is due to their office, but we only owe our esteem and affection to their virtues" (bk. i. ch. 3). Having satisfied his conscience with this restriction, Montaigne, who lived in the midst of the havoc of religious and civil wars, invariably repeats that he is "disgusted with novelty, whatever may be its features" (bk. i. ch. 22).

He had come to the conclusion that "the profit of one man is the loss of another" (bk. i. ch. 21), and expressly mentions the merchant as an illustration. On sumptuary laws, he is more enlightened; he considers them as going against their object, as good examples derived from kings and great people would be much more effective (bk. i. ch. 43). Some hints on the desirableness of instituting municipal offices of information, and on the usefulness of keeping detailed and accurate family journals and account books (bk. i. ch. 34), are probably the only remaining utterances of Montaigne which ought to be noticed here.

E. Ca.

MONTANARI, Geminiano (1633-1687). Born at Modena, Italy. An able mathematician and astronomer, he was mathematical professor for fourteen years at the university of Bologna, and afterwards professor of astronomy and meteorology at the university of Padua, in which city he died. To students of economics he is known by his two works on coins, written about 1680, and published seventy years later by Argelati in his collection of works on coins, and afterwards reproduced in the collection of Custodi. These works possess much merit notwithstanding the evident traces of the influence of Bodin—an influence greatly felt by all thinkers at that period.

Fluent and animated in style, Montanari freely criticises the mistaken views held in his day on the coinage question, and the injurious effect of alterations in coins, and the raising their nominal value; and points out the rules which should be observed in coining money at the mints. His investigations on money necessarily lead him to an examination of the question of value. He combats the idea of an invariable relation of the value between gold and silver asserted by Bodin and Scaruffi. He reduces the laws of value to the element of scarcity —understanding scarcity not as absolute, but relative to the extent of the demand.

In his researches, says Graziani, Montanari succeeds in explaining all the general phenomena of value, though without thoroughly understanding the intricate and difficult subject—the value of money.

Breve trattato del valore delle monete in tutti gli stati, 1680.—*La zecca in consulta di stato, trattato mercantile*, etc. 1687. Republished by Custodi in his collection of Italian classical economists, under the title of *Delle monete, trattato mercantile*.

[Cossa, *Introduction to the Study of Political Economy*, London, 1893.—Bianchini, *Della scienza del ben vivere sociale*, Palermo, 1845, p. 170.—Graziani, *Le idee economiche degli economisti emiliani e romagnoli*, Modena, 1893, pp. 45-48.] U. R.

MONTAZGO, called *carnerage* in Aragon, a toll levied by Spanish kings on migrating flocks of cattle at certain passes in the mountains. It was suppressed in 1758.

[Canga Argüelles, *Diccionario de Hacienda* (London, 1826). See also Mesta.] E. Ca.

MONTCHRÉTIEN, Antoyne de (*c.* 1576-1621), a Huguenot, a second-rate poet, and a hard-ware manufacturer, dedicated in 1615 to the king (Louis XIII.), and the queen-mother, his *Traicté de l'Œconomie Politique*. This seems

to be the first work ever issued under that title; and the use of the phrase is undoubtedly significant. But there is absolutely no ground for the assertion, maintained by some enthusiastic French writers, and notably by his latest editor, M. Funck-Brentano, that Montchrétien was the creator of political economy, or even that he was in any way a considerable economist. There is hardly a single argument or proposal in the book that is not borrowed from earlier writers; the passages which have been most praised for the trade policy they advocate are taken almost verbatim from BODIN. The book is really nothing but a thick mercantilist pamphlet; its style is grandiloquent and long-winded, and full of repetitions; and it is only valuable for the miscellaneous information it gives as to contemporary conditions of industry and trade in France.

The *Traicté* has been edited with a long introduction by M. Funck-Brentano (Paris, 1889); and its unoriginal character demonstrated in the *Eng. Hist. Rev.*, vi. (1891), 779. W. J. A.

MONTESQUIEU, CHARLES DE SECONDAT BARON DE LA BRÈDE ET DE MONTESQUIEU (1689-1755), born and died at La Brède near Bordeaux. One of the ablest thinkers of the 18th century, he may be considered rather a student of political science than of political economy alone, a science which in his time scarcely existed, at least not as a distinct branch of study. Following on some works in which he asserted more than he could prove, Montesquieu wrote in 1721 his *Lettres Persanes*, which for a time were all the fashion, and seven years later (1728) opened to him the doors of the French academy. This book, keen and witty criticism as it was of the men of his time, would not, however, have secured to the author that widening renown which his name has attained.

The works which have immortalised the name of Montesquieu are the two following: the first, critical and historical, is entitled *Considérations sur les causes de la grandeur des Romains et de leur décadence*, 1734; the link it possesses with economic science is through politics, as in the passage, "It is not fortune (in our time we should say chance) which rules the world. . . . There are general causes—moral or physical—which operate in each kingdom, which raise, preserve, or ruin it; every accidental occurrence is subordinate to these causes; and if the chance of a battle, that is to say a particular cause, ruins a state, this takes place because there was a general cause which led to the destruction of the state by a single battle. In short the principal force induces all particular accidents," ch. xviii. Again, the universality of immaterial laws is asserted thus: "As men at all times have had the same passions, though the occasions which produce great changes are different, the causes are always the same" (ch. i.).

The second book, *De l'Esprit des Lois*, 1748, on a much larger scale than the first, was written throughout in the same exact and concise style peculiar to the author, and had been under preparation for some time (1728-1748), the latter year being the time of its appearance. The reputation of this masterpiece has increased with time; but it was warmly welcomed even on its first appearance.

Madame du Deffand said with a sneer, that it was "de l'esprit sur les lois." Voltaire appreciated it more highly when he wrote "the human race had lost its title-deeds; M. de Montesquieu has found them and returned them." The fact is, that though the work may have grown antiquated both in form and through the advance made in moral and political science during a century and a half, it attains in many passages a marvellous elevation, which excites first astonishment and then admiration. The remarks on the influence of climate on national character and economic condition, bks. xiv.-xvi., are among Montesquieu's most characteristic points. Some passages on economic questions may be selected, in which the author is indisputably in advance of his age. Thus in bk. xx. ch. ii. "The natural result of commerce is peace. Two nations trading with each other make themselves reciprocally dependent. If it is to the interest of one to buy, it is to the interest of the other to sell, and all unions are founded on mutual necessities." Bk. xx. ch. ix., "it is commerce which sets the right value on commodities, and which establishes true relations between them." In the countries in which loans of money at interest are not regarded favourably by the law, "the lender takes on himself the risk of breaking the law," and "the rate of interest increases in proportion to the risk of the loan not being paid." "Continence is naturally linked with the expansion of the race," bk. xxiii. ch. ii., written a century before MALTHUS, he appears to anticipate some of that writer's conclusions. Montesquieu was in favour of direct taxation of individuals, not a taxation in proportion to their wealth, but a taxation in proportion to the surplus remaining after the satisfaction of their ordinary wants. In short, he proposed to divide the citizens, as at Athens, into classes, according to the condition of the individuals. No doubt there were economic subjects on which he too readily adopted the mistakes of his time. He supported the sale of offices; he inclined to the mercantile system; he had no clear idea of the economic position of money, though he said, and rightly, "that the use of money by a nation was one indication of civilisation," bk. xviii. ch. xv. He preached also the equalisation of individual property, sympathising too much with the spirit of Lycurgus in this. It was the influence of this spirit which caused him to regard a long-continued period of national security as leading to corruption and decadence. He would willingly have consented to give up the use of money to attain the ideal of government realised by the Jesuits in Paraguay. Though he could not free himself from some of the economic errors of his time, Montesquieu showed often, and on points of the highest importance, the superiority of his judgment. In these cases he was much in advance of his contemporaries. It should not be forgotten that his book *L'esprit des lois* appeared ten years before the *Tableau Économique* of Quesnay, and twenty

eight years before the reforms of Turgot and the publication of the *Wealth of Nations*. This great thinker dominated his own age and often anticipated the economic ideas of the future.

[See references to Montesquieu in A. Smith, *W. of N.*, bk. i. ch. x., as to effect of law on rates of interest; bk. v. ch. i., as to education and morals among the Greeks. — Hume, *Essays*, No. XI., on "Populousness of Ancient Nations," and in note T.] A. C. f.

MONTHLY ASSESSMENTS were a tax first levied by the long parliament during the civil war, continued throughout the commonwealth, and occasionally used under Charles II. and William III. They were an improvement upon the old SUBSIDIES, being more evenly assessed rather than more productive. A sum, based upon the highest produce of a subsidy, was fixed, and proportionately assessed upon both real and personal property by local commissioners for each county; it was levied upon occupiers, to be by them deducted from their rent. Church lands and goods were included, and it was the establishment of this as permanent which occasioned the cession by the clergy in convocation of their taxing powers in return for the right of voting at parliamentary elections. The tax varied from £35,000 to £120,000 a month, and was generally levied for three or more months in succession, a proportionate sum being also sometimes obtained from Scotland and Ireland. After 1690-91, the year of the highest sum ever raised by this tax, monthly assessments gave way to a new form of property-tax.

[Dowell's *Hist. of Taxation*, vols. ii. iii.—For details of assessment in 1660 see Sinclair, *Public Revenue*, i. 304, note.] E. G. P.

MONTHS, FOURTHS OF. In any analysis of the returns of the Clearing House, reference is frequently made to the "Fourths of the Month." The origin of this is found in the fact that a custom exists in many branches of trade to date the bills drawn on their debtors on the first day of the month. These bills become, according to the English mercantile law, by the operation of the DAYS OF GRACE (*q.v.*), payable on the fourth of the month in which they fall due. Hence a larger number of purely commercial transactions, as a rule, pass through the Clearing House on the fourth of the month than on any other day, and the amount of the returns is regarded as a proof of activity or slackness in trade. This observation refers, as stated, to the "purely commercial transactions"; those on stock exchange account days, and consol settling days, largely exceed the "fourths of the months," but it is only the latter which are under notice here.

The table which follows shows the amounts paid on the "fourths of the month," since the commencement of the publication of the clearing house returns in 1868, omitting 1869-96 inclusive, to the present time. The totals of the annual clearings are likewise added, and columns of proportional figures. By these the progress of the transactions of the "fourths of the month," relatively to the total transactions can be easily traced. It will be observed that the amount of business done on the "fourths of the month" has not kept its own relatively to the total transactions. This corresponds to the known fact that fewer bills of exchange are now drawn in proportion to business done than used formerly to be the case. At the same time the "fourths of the month" are still of some importance, and the amount of business done on those days is carefully watched and noted by those engaged in business. W. H.

London Clearing House Returns, 1868-1919. Amounts on the 4ths of the Month and the total.

1 Year.	2 Clearings on Fourths of the Month.	3 Prop. of amount in each year to 1868. 1868 = 100.	4 Prop. of Fourths of the Month to total.	5 Total Clearing for the Years.	6 Prop. of amount in each year to 1868. 1868 = 100.

MONTS DE PIÉTÉ. Early in their history several small Italian states exacted from their citizens forced loans, on which interest was paid;

the sums of money thus raised formed what was called a *mons*, or heap. The name of *montes pietatis* is derived from this; the second word distinguishes these from the earlier founded *montes coacti*, and is given to the charitable funds for granting loans on the security of pawned articles, which were established in Italy towards the middle of the 15th century (Orvieto, 1463, Perugia, with papal authority, 1467, Viterbo, 1472, etc.). The Franciscans were their warmest advocates, and various spiritual and temporal privileges were granted to the contributors to this pious purpose; but as they proved inadequate to attract the necessary funds, several *montes* began to accept deposits at a moderate rate of interest. This, and the levying a small percentage to cover working expenses, gave rise to a fierce controversy between the Franciscans on the one side and the Dominicans on the other, the latter maintaining that the system was based on usury (see CANON LAW). However, in 1515, the Lateran council and the pope, Leo X., sanctioned the right to levy a moderate interest, provided the object were not to realise a private gain. Thenceforward the Italian *monti di pietà*, mostly under ecclesiastical management, enjoyed the steady protection of the popes, though some of them, especially the *mons* in Rome, assumed much of the character of a bank, and became owners of considerable property.

In Spain, notwithstanding the national religious devotion, and the rapid success of these institutions in the Spanish Netherlands, the first *monte de piedad* was not founded till the beginning of the 18th century under Philip V., the first king of the Bourbon dynasty. They now exist under government supervision in the most important towns. The *montes de piedad* are to be distinguished from the numerous *montes pios*, which like the *montes granatici* in Italy, supplied corn, wine, and agricultural produce generally, to the population during periods of scarcity or at seed-time.

North of the Alps, the *monts de piété* found at their first introduction a congenial soil in the Netherlands, where the pawning business had until then been monopolised by Italian money dealers, whose authorised rate of interest varied from 20 to 55 per cent, and who, in the popular Flemish language, have left their name (*Lombaard*) to the *monts de piété*, although a designation literally translated from the French (*Berg van Barmhertigheid*) has taken its place in modern times. They were first introduced in 1618 by Wenceslas Cœberger under archduke Albert, and soon were in operation in all the principal towns. Placed under the control of a general superintendent, they rather combined the characteristics of banking and of charitable establishments, lending at from 15 to 18 per cent. In modern Belgium the managing officers are appointed by the communal authorities, and the funds supplied primarily by the *Bureaux de Bienfaisance* (poor boards), secondarily by the municipality itself.

In Germany, the civic authorities had, from the commencement of the 14th century, established banks on their own account in some of the imperial towns, Frankfurt 1402, Nuremberg 1598; these banks cleared the way for the adoption of *Pfandhäuser* on the Italian model. The first of these was founded in 1591 at Augsburg and still exists. This example was soon followed in Nuremberg, Ulm, and later in Hamburg (1650). A great number of these establishments, often of a municipal, sometimes of a private character, were started during the 18th century. Owing to the federal constitution of the German empire and the legislative powers of the individual states, state, municipal, and private *Leih* and *Pfandhäuser* co-exist at the present day; the Berlin *Leihhaus*, for instance, is a royal institution. The ruling principle may be stated thus: private *Pfandhäuser* must be licensed, and are submitted to control by the local authorities, but the licence cannot be withheld on other grounds than personal unworthiness, or the absence of the need for such an establishment. The authorities of each state may require its foundation, wherever the want is felt. Generally speaking, the same system of licensing prevails in Austria.

In France, notwithstanding some ineffectual attempts under Louis XIII. and Louis XIV. it was long before the *Monts de Piété* were naturalised. After 1577 one was installed in Avignon, which city was papal territory until the French Revolution. In 1777 a royal patent was granted to the managers of the hospitals to set up a house for loans on movable pledges in Paris; they lent at 10 per cent *per annum*, and from 1777 to 1789 the yearly totals of their loans amounted on an average to about 8,000,000 sterling. The National Assembly decreed the liberty of the profession, and during the troubled period of the first republic the most frightful abuses ensued. In 1797 the Directory appointed five *administrateurs* of respectability to re-open the *Mont de Piété*, which had been closed in 1795, and to start it anew with their own capital, amounting to £20,000. The rate of 3 per cent per month at which they advanced money was gratefully hailed by crowds of needy borrowers. Through the confidence they inspired, the *administrateurs* were able to raise money on lenient terms, and gradually to bring down the rate of interest on their own loans to 12 per cent per annum. In 1804 Napoleon paid off their shares, and the Paris *Mont de Piété* became a public institution enjoying a monopoly for this kind of transactions. Until 1840 twenty-four *commissionnaires* acted as intermediate agents between the population of distant quarters and the *Mont de Piété* itself, but they were then suppressed, and branch establishments

organised in their place. Similar institutions are now to be found in all the chief towns of France; under a law of 1851, they must be authorised by the municipal council and managed by a paid director assisted by a board, whose unpaid members are appointed by the prefect and presided over by the *Maire*. The surplus of receipts over expenses, after a proper deduction for forming the necessary capital, must be paid over to hospitals or other charitable institutions, according to the decision of the prefect. The *Monts de Piété* are entitled to accept donations and legacies.

The contracting a loan is authenticated by a document called *reconnaissance;* the value of the article pledged is ascertained under the joint responsibility of official *commissaires priseurs;* and as *reconnaissances* are transferable, this way of proceeding has given rise to a rather unpleasant traffic based on the lowness of the estimates (see the *Économiste Français*, August 1890, p. 133). At the end of the stipulated term, generally one year, the articles must be redeemed or the engagement renewed; if these formalities are not gone through, they are sold by public auction, the borrowers having three years to claim the eventual surplus resulting from the sale. Any borrower may require the sale of the articles he has deposited at the end of three months. The Paris *Mont de Piété*, whose operations exceed those of the forty-one provincial *Monts de Piété* (say about £1,400,000 against £1,000,000 a year), grants advances, since the beginning of 1894, on securities such as shares, debentures, national stock, etc. It accepts deposits at from 2 to 3 per cent, and charges 7 per cent (commission included) on its loans.

Many objections have been made to *Monts de Piété*. It has been said that they put on the same footing the spendthrift, the prostitute, and the deserving head of a family, and that they deprive the borrower of the use of the pawned articles, whilst the owner of a mortgaged property can earn the monies required for payment of interest and repayment of principal. Still it cannot be doubted that there is a great deal of truth in Turgot's opinion (in his *Mémoire sur les Prêts d'Argent*), that "the poor man is happy to find the assistance he wants without being exposed to any other risk than the loss of his pledge." (See CANON LAW; PAWNBROKING.)

MONTYON, ANTOINE ROBERT AUGET, BAROL de (1733-1820), was born and died in Paris. Montyon was known chiefly by the establishment of his "prix de vertu," and also by the Montyon *prix de Statistique* founded in his honour, and won, among others, by LE PLAY.

He left two works, still often read, though they contain much rubbish mixed only with a little that is good. These are: *Quelle influence ont les diverses espèces d'impôts sur la moralité, l'activité, et l'industrie des peuples*, 8vo, 1808, reprinted in 1848 in Guillaumin's collection (*Mélanges d'économie politique*, t. ii.), and *Particularités et observations sur les ministres des finances de France les plus célèbres de 1690 à 1791*, 1812, 8vo. In the first of these works, Montyon writes rather as a philanthropist than an economist or a financier. He desired that taxation should inculcate morality, should favour marriage, be heavy on those who remained single, and hinder luxury. In the second, he extolled NECKER, and declares that TURGOT had done nothing important for the prosperity of France. He showed his firmness of character when he chose rather to forfeit his position as commissioner than to acquiesce in the violation of the irremovability of the magistrates committed in 1771, by the chancellor N. de Maupeou, the protégé of Mme. Du Barry. A. C. f.

MONYPENNY, DAVID, author of a work on the *Poor Laws*, "a work of considerable authority," M'CULLOCH (*Lit. of Pol. Econ.*, p. 298).

He wrote: *The claims of the Established Church of Scotland on the country . . . in the present Crisis. . . .* 2nd ed., Edinburgh, (1838 ?), 8vo.—*Proposed Alterations of the Scottish Poor Laws . . . considered and commented on.* Edinburgh, 1840, 8vo.—*Remarks on the Poor Laws and on the Method of Providing for the Poor in Scotland*, 1st ed., 1834, 8vo, 2nd ed., with additions, 1836, 8vo. A. L.

MOORE, ADAM (fl. 1650) was author of *Bread for the Poor and Advancement of the English Nation promised by enclosure of the Wastes and Common Grounds of England*, London, 1653, 8vo. Moore lays stress on the effect of adjacent commons in engendering idleness, with its consequence, penury. Commons being divided into "uplandish" and "marish," their respective merits as breeding and feeding places for horses, cattle, and sheep, and as providing fuel, are dealt with. The conclusion is that one-fourth part of the commons, when improved, will be worth as much as the former whole. Assuming that there are two million acres of such wastes in England and Wales, the enclosure of one-fourth of these will maintain an additional 750,000 of population. Moore proposes a "grand committee" for each county to settle private claims. The poor cottagers are to be protected by the portions allotted to them being held in free SOCAGE for ever, under a small yearly rent. The value of

their holdings would be thus raised from about 3d. to £40 or £50 (see ENCLOSURES).

[The merits of the tract have been perhaps overrated by M'Culloch, *Literature of Political Economy*, but its value as historical evidence is undeniable.] H. E. E.

MORA. A party to an obligation who fails to perform what is due from him when he has received notice from the other party demanding performance, *interpellatio*, is, according to the terminology of Roman law, *in mora—mora debitoris*. From the time of its occurrence he is bound to put the party who makes the claim in an equally favourable position, as if performance had been made without any default. So he must pay interest from that date, though he may not previously have been liable to do so; and he becomes liable for all loss or damage attributable to accident, as well as to negligence, where he holds the property of another as bailee. So too, if the thing to be delivered falls in value after *mora* has set in, he must pay the highest value the thing has reached since that occurrence, unless he can prove that the party to whom he should have made delivery of the thing would not have disposed of it.

In some cases actual notice of the claim is not necessary to constitute *mora*, as when a future time of payment is fixed by the contract, according to the maxim, *Dies interpellat pro homine*. A party who is entitled to performance may be in *mora—mora creditoris*—on his side. This happens if he refuses to accept performance, when performance is duly tendered to him. The effect of this is, not to discharge the obligation, but to make him liable for all loss to the other party, which is a consequence of his not having accepted performance.

E. A. W.

MORAL RESTRAINT. See MALTHUS.

MORALITY, SYSTEMS OF, IN RELATION TO POLITICAL ECONOMY. The relation of morals to economics is often misunderstood. Political economy is, properly speaking, a science rather than an art. It aims in the first instance at the explanation of a certain class of facts, the facts, namely, of the production and distribution of wealth. The special knowledge of economic facts possessed by the economist may enable him to give valuable advice on economic questions, but this, strictly speaking, is not his business. His business is to explain, not to exhort. It is therefore beside the mark to speak of economists, as such, preaching a low morality or rejecting morality altogether. There is, however, a real relation between economics and moral science. For the facts with which political economy is concerned are in great measure facts of human conduct, and all human conduct is included in the field of moral inquiry. Hence a twofold connection between morals and economics. For in the first place the economist cannot explain the action of human beings with reference to wealth, unless he has a theory of human nature, and a theory of human nature must include a theory of morals. The theory of morals of an economist need not be original or peculiar; it may not even be very clearly conceived; but a theory of morals he must have. The economist's theory of human nature and of morals will affect his account of the motives which unfit men for exertion, of the uses of competition, of the effects of the institution of private property, the influence of slavery or of personal freedom, of the economic bearing of different forms of religious belief or political constitution, of the result of different occupations on the economic capacity of man, of the economic results of the growth of population, the subdivision of land, the increase of luxury and countless other phenomena which come within the purview of his science. Thus the Greek theory that complete leisure is necessary to the perfect life, led ARISTOTLE to hold that there must exist a class of producers themselves incapable of that life, but making it possible for those who were more gifted. Aristotle concluded therefore that the institution of slavery which he found in existence was a necessary condition of the highest civilisation. The mediæval doctrine that it was sinful to take interest for money, tended to prevent any exhaustive inquiry into the nature and uses of capital. The modern doctrine that comfort is an aid to virtue, and an abundance of means a help towards a good life, has led speculative minds to devote much more attention to the processes of production and distribution, and to take a much more complacent view of lives spent chiefly in the acquisition of wealth. How differently different minds will interpret the same economic facts may be seen by comparing Adam SMITH with RUSKIN. To Adam Smith happiness, that is the greatest amount of pleasure and the least amount of pain, was the only rational end of action; he approved of personal freedom and competition as means to this end. To him, therefore, modern society appears to be in a constant state of improvement. Ruskin does not allow that happiness in this sense is the end of action. He maintains that subordination and co-operation are the true means of obtaining the highest good. He therefore regards as indications of decay much that Adam Smith regards as indications of improvement. In no science, least of all in the sciences which deal with man in society, can there be such a thing as pure passive observation. The scientific intellect always brings as much as it finds, and unconsciously imposes its forms of thought on the object which it studies. What we are and whither we are going nobody can fully tell; and each

man's version of human character and destiny is tinged with the colour of his own mind.

The charge of a low morality so often brought against the classical economists rests partly, no doubt, on the misconception of supposing that they approved of everything which they recorded, but it also rests partly on the fact that they accepted the current moral theories of their time. These theories were various forms of what is known as HEDONISM (Gk. ἡδονη, pleasure). LOCKE and his successors were supposed to have shown that the soul is a mere sentient subject. If this be so, good must mean pleasure, and evil pain. The rational end of action must be the greatest amount of pleasure with the least amount of pain. This moral doctrine took two principal forms, one egoistic, the other philanthropic. According to the egoistic or Epicurean version the individual can seek only his own happiness; according to the philanthropic or utilitarian version he can seek and should seek the happiness of all. The link between the two theories is supplied through the social instinct, by gratifying which man secures at once his own happiness and that of his fellows. The utilitarian doctrine, first outlined by HUME, and afterwards elaborated by BENTHAM, seems to have been the theory of morals accepted by Adam Smith, by MALTHUS, and by most of their immediate disciples, French and English. But the philosophic and practical shortcomings, even of this enlarged hedonism, were severely exposed in the philosophical reaction of the 19th century. With all its kindliness and common sense the favourite moral theory of the older economists appeared defective both in depth and in elevation. They were accused of explaining social phenomena by the help of a low conception of human nature. The charge was grossly exaggerated, but it was not altogether destitute of foundation. Later economists frequently seem to have no definite theory of human nature, good or bad.

In the second place the economist has to take account of the various theories of morals which have found acceptance in different ages and countries. It is true that the mass of mankind never formulate a theory of conduct. Men act upon instinct, but the instinct implies a doctrine, and this doctrine is made explicit by the accredited teachers of the day, philosophers, priests, or men of letters. Did space allow, it would be easy to show how different has been the influence upon the production and distribution of wealth exercised by the classical, the mediæval, and the modern ideals of conduct. But the subject would require many volumes for its elucidation. The position taken by economists with reference to morality and systems of morals is to be understood rather by the general tenor of their writings than by reference to particular passages. It is the utilitarian spirit, not the utilitarian dogmas, which so many of the older economists adopted.

MORATORY LAW. A moratory law is a law passed in times of emergency, postponing for a specified time the due date of bills of exchange and other obligations. The delay or period of grace accorded by the law is sometimes, though not perhaps correctly, spoken of as a "moratorium." During the Franco-German war of 1870-71 moratory laws were several times passed by the French government. Their international effect was discussed at length and their validity upheld in the case of *Rouquette v. Overmann* (1875) L.R., 10 Q.B. 525. It is of the essence of a moratory law that it should be enacted to meet some special political or commercial emergency. For example the Bank Holidays Act 1871, which makes all bills maturing on a bank holiday payable on the succeeding day, could not properly be described as a moratory law, because it is a permanent enactment. (See also MORA.) M. D. C.

MORCELLEMENT. This French term, literally "parcelling," is specially used to express the division of land among small peasant proprietors. Those French writers who believe that this division has been pushed to a dangerous extent, also frequently employ the expressions *émiettement* (reducing into crumbs) or "pulverisation" (in German *Zwergwirthschaft*).

It is applied both to cultivation and to ownership of land. In the former sense, much naturally depends on the kind of cultivation peculiar to the region, as corn or the vine, and to the opportunities for the sale of produce —as garden cultivation near large towns. Leaving for the moment this aspect of the question, and dealing exclusively with the *morcellement* of ownership, we notice first that it is a mistake to suppose that the existing division of land in France is entirely due, as is often stated, to the operations of the *Code Civil* (articles 815-842), enacting that the children of a deceased landowner are entitled to claim shares of his property equal in value and in kind. As known by all readers of Arthur YOUNG, the number of PEASANT PROPRIETORS in France was large before the French REVOLUTION, the principle of the present laws of succession being then in force for the property of commoners. In a paper read in 1889 before the

International Institute of Statistics, and published in the *Bulletin du Comité des Travaux Historiques et Scientifiques* of the ministry of public instruction for 1890, pp. 98-116, a French statistician, M. Gimel, computed the number of taxed landowners, before the French revolution, consequently excluding the privileged *noblesse*, at four millions. The fact is that the abolition of entails, the confiscation and sale by auction of the *nationalised* estates, and the extension of the equal division of successions, combined to give a powerful impulse to an already existing tendency.

To ascertain the present number of landowners in France, the number of *cotes* or individual "extracts" from the communal rolls of direct taxation on real property has first to be taken; then as the same man often owns land in different *communes*, it is calculated that the number of *cotes* is about twice that of the number of actual proprietors. M. de Foville, the best authority on this subject, estimates the number of owners of real property in France at the following dates as follows:

Before the Revolution. . .	4 millions.
About 1825 . . .	6½ ,,
About 1850 . . .	7 ,,
In 1875	8 ,,
In 1890	from 7½ to 8 millions.

According to the decennial *Enquête* of 1882, out of the total number, 4,835,000 are rural landowners, of whom 3½ millions personally cultivate their own land.

In the agricultural *Enquête* of 1884, a classification based on the extent of land individually owned was included and carefully carried out; it shows the following proportional percentages for very small, small, medium-sized, and large properties.

Land.	Number of *cotes*.	Occupied Area.
	per cent	per cent.
Under 2 hectares (5 acres) . .	74·09	10·53
From 2 to 6 hectares (5 to 15 acres)	15·47	15·26
From 6 to 50 hectares (15 to 125 acres)	9·58	38·94
From 50 to 200 hectares (125 to 500 acres)	0·74	19·04
Above 200 hectares (500 acres) .	0·12	16·23

The number of 10,426,328 *cotes* or "extracts" covering an area of 5,211,456 hectares or 13 millions of acres, is given for the very small properties under 5 acres. This shows that in France small and even diminutive peasant proprietorship certainly exists to a considerable extent. Still it is intermingled with a far larger proportion, in area, of medium-sized and large ownership, and it cannot consequently be maintained that as a rule the land is in a state of "pulverisation." In fact, the majority of these Lilliputian holdings are cottages with gardens annexed; and it will not be foreign to the present subject to state that a recent official inquiry on house property, 1887-1890, has shown that out of a total of 8,914,500 houses and dwellings, 4,969,200 were wholly and 491,100 partially occupied by their owners. There are 36,000 *communes* in all, and it is impossible to find a single house or cottage let to a stranger in more than 2000 of these.

The French legal system of inheritance has found opponents both among the friends and the enemies of small peasant-proprietorship. Among the former must be reckoned LE PLAY and his disciples, who contend that this system defeats itself when the hereditament is too small to be conveniently divided, as, in that case, the property is offered for sale and bought up by investors with capital or rich neighbours, who add their purchases to their own estates. As a remedy, they propose the introduction of the American HOMESTEAD AND EXEMPTION LAWS (*q.v.*). The mere abrogation of the article of the *Code* which enjoins compulsory division in shares of the same *kind*, would probably be more favourably accepted by public opinion. Another objection, which is directed against the *petite propriété* itself, maintains that it leads to neo-Malthusianism amongst French peasants; the *petite propriété*, however, exists on a large scale at the present time in Belgium and in many parts of Germany; both these are countries where the population is increasing rapidly; consequently rural neo-Malthusianism in France cannot be exclusively or even mainly ascribed to the division of land. Besides, in France itself the departments, where population is stationary or decreasing, are not invariably those where the average size of ownership in land is the smallest.

In former time, QUESNAY alleged against the *petite propriété* that it is comparatively less productive than the larger estates owned or farmed by men familiar with the art of scientific cultivation, and in possession of considerable capital. In France this objection is no longer heard much of, as most people believe that the greater energy of the small freeholder amply compensates any inferiority in this respect. This greater energy finds full scope for its exertions in several branches of culture, as vine-growing and market-gardening, to which the soil and climate of France are peculiarly congenial, and which accordingly have spread and prospered there. Moreover, this objection also applies rather to extreme division of cultivation than to extreme division of ownership, and loses much of its weight in practice, because small landowners often farm land belonging to other people and make up thus a fair-sized occupation. However, it cannot be denied that the division of cultivation arising from an excessive separation of property has in many instances and for a long time caused waste, but, where this was or is the

case, the remedy is readily available by mutual exchanges, and by what has been called *commassation* or *remembrements*. From 1860-1890, M. Gorce, a surveyor in Nancy, has thus been empowered by syndicated groups of landowners to redistribute their lands and fields, and has carried out this operation in twenty-five communes of the department of Meurthe and Moselle with such success that the average increment of value of the land thus redistributed has been valued at 500 francs per hectare, or £8 per acre. On the other side of the Rhine, and also in Germany and in Austria, a legal sanction has been granted to *commassation*, and the decision of a majority made binding for the whole local body of landowners; it is stated that two millions of separate and widely dispersed hectares, five millions of acres, have thus been consolidated into groups of connected areas.

Last and by no means least important, it is generally felt on the continent that the existence of a numerous class of very small but independent peasant proprietors is one of the safest bulwarks against the disintegrating influences at work in large closely-peopled centres.

[The standard work on the subject is M. de Foville's *Morcellement*, Paris, 1885. The same author wrote the article "Morcellement" in the *Nouveau Dictionnaire d'Économie Politique*, 1892. All French writers on agriculture from Olivier de Serres downwards, and the physiocrats and economists of the last century, have more or less examined the question. ROSCHER in his *Nat. Oekonomik des Ackerbaues* (12th ed. 1888, bk. ii. chs. 4 and 11), concludes in favour of a state of equilibrium based on a judicious mixture of large, middling, and small holdings. For the special literature see MOREL DE VINDÉ, *Considérations sur le Morcellement*, 1826.—Faucher, *État et tendances de la petite propriété en France*, 1836.—H. Passy, *Essai sur la division des héritages*, 1838.—Piogey, *Du Morcellement du Sol en France*, 1857.—Legoyt, *Du Morcellement de la propriété en France et en Europe*, 1865.—Bretagne, *Étude sur le cadastre et les abornements généraux*, Nancy, 1870.—Gimel, *Division de la propriété dans le département du Nord*, Lille, 1877.—*La Division de la propriété*, 1883.—*Mémoire sur la Division de la propriété avant et après* 1789, 1889.—Lavergne, *Économie rurale de la France*. MORE, SIR THOMAS (*c.* **1478-1535**), was born in Milk Street, Cheapside, in 1478 (Seebohm's *Oxford Reformers*, Appendix C.), or about 1480 (C. More's *Life of Sir Thomas More*, which was published in 1627 according to Lewis and Singer, in 1631 according to Hunter). After being educated under Nicholas Holt, and living as page in Archbishop Morton's household, and learning Greek as well as Latin in Oxford—probably at Christ Church (C. More), Thomas joined Lincoln's Inn 1496; was called to the bar, made reader at Furnival's Inn, and under-sheriff of the City of London (1502-1519). In 1505 he married Jane Colte, by whom he had a daughter Margaret, afterwards wife of William Roper his biographer, and two other daughters and one son. As burgess of parliament he defeated Henry VII.'s demand for an aid on the marriage of his daughter (1504), which offence cost his father imprisonment and £100 fine, and drove the offender from the highway of his profession into the quiet bye-paths of historical and literary compositions (*e.g. Historia Richardi III.; Epigrammata*, etc.). Under Henry VIII. he returned to the law, and as counsel for the pope beat the king in a case of forfeiture which came before the Star Chamber; which service the defeated litigant rewarded with knighthood, a mastership of requests, and a privy councillorship (Roper's *Life of More*, written about 1557, pub. 1626). About 1521 he was made under treasurer, and in 1523 speaker. As speaker, he defeated Cardinal Wolsey's tyrannous attempt to compel the Commons to discuss in his presence the grant of a subsidy (Roper, confirmed by Hall's *Chronicle*, p. 656; Brewer's *Hist. of Henry VIII.*, 469, misleading); yet the king at this time was a constant though not over-welcome visitor at Chelsea, and Sir Thomas was made chancellor of the Duchy of Lancaster (1526-32). In 1529 he was ambassador to Cambray in order to conclude a league between Francis I., Charles V., and Henry VIII. Henry used at this time to urge Sir Thomas to declare against the papal dispensation which legalised his marriage with his sister-in-law Queen Katherine, and Sir Thomas replied by pointing out authorities opposed to the king's contention (*e.g.* St. Augustine), and by pleading inability to offer an opinion of his own in the matter. On 25th October, Wolsey having fallen, Sir Thomas was made lord chancellor. It was as lord chancellor that Sir Thomas had to inform both houses of parliament of replies from the universities of Oxford, Cambridge, Bologna, etc., declaring the king's marriage void (Gairdner's *Letters and Papers of the Reign of Henry VIII.*, vol. v. No. 171); and he discharged this irksome task without adding views of his own but resigned soon afterwards (16th May 1532), and retired on £100 a year. The clergy subscribed £5000 to reward him for his theological polemics (*e.g. Responsio ad Lutherum*, 1523), but he would not accept a penny from them. Then his persecution began, first for bribery as lord chancellor, then for complicity with Elizabeth Barton, attainted of high treason by 25 Henry VIII. c. 12. Both charges broke down, the first ludicrously, the second ominously, More remarking "quod differtur non aufertur." For the king's "Act of Matrimony and Succession" was even then being passed (25 Henry VIII. c. 22), and section ix. of the act (confirmed by 26 Henry VIII. c. 2) made it misprision of treason not to swear

"to defend all the contents of the act and of every part of it," and the act, besides regulating the succession, which More offered to swear to (*English Works*, ed. Rastell, 1557, p. 1428), declared Henry VIII.'s marriage with Katherine null. Sir Thomas would not swear what he did not believe, and went to the Tower (April 1534), and was deprived of his estates in November (26 Henry VIII. c. 23), (*Archæologia*, xxvii. ; p. 369, *Froude*, ii. 242 misleading). The same parliament of November 1534 enacted that the king should be and have the title of Supreme Head of the Church (cap. i.), and that it was high treason to contrive to deprive him of any of his titles (cap. xiii.). Rich's perjured testimony (which Froude alone believes) brought More within the scope of these two last mentioned enactments. He was tried for high treason on this last charge (1st July) and executed (7th July). Stapleton's *Tres Thomæ* (1589), and perhaps Hall's *Chronicle*, represent More as an ultramontane protagonist, whereas he was an advocate of præmunire (Roper, ed. Singer, 1822, p. 66); Mr. Froude (*Hist. of England*, ii. 395), citing a story of Roper's p. 73) as mistold by C. More (whom he miscalls Sir Thomas's grandson), suggests that More had spoken seditiously against Anne Boleyn, a suggestion never made at the time. Roper, followed by Rev. T. E. Bridgett in his *Life and Writings of More* (1891), says that More refused "an oath of supremacy" which never existed: Lord Campbell (*Lives of the Chancellors*, i. 564), ignoring 25 Henry VIII. c. 22, declares that More's commitment to the Tower was illegal. All these statements and suggestions are erroneous; Sir James Mackintosh's *Life of More* (1831), as supplemented by the actual Indictment and Lady More's Petition (printed in 1838 in *Archæologia*, xxvii. 370) contain the only true and full account.

The character of Sir T. More, as drawn by his trusty biographer Roper (whom Stapleton and C. More only echo and add to) is a classic picture of a perfect gentleman. His even and Socratic temper was never ruffled. The stories about More's cruelties to Protestants, which arose fifty years after his death, and have been lately revived by Froude and the *Dictionary of National Biography* (1894), may be dismissed as fabulous (Bridgett, ch. xiv.). Erasmus was his friend since 1497 (Ep. 14), (Froude, *Erasmus*, pp. 43, 111, etc.), and his description of the Chelsea home, which all the children and eleven grandchildren shared, illustrates the domestic virtue of Sir Thomas as vividly as Roper's picture of the lord chancellor kneeling before his father the judge in the judge's court, and asking a blessing before going to his day's task. So strong and so gentle, so bright and so unworldly, so good a son, and father, and citizen, this saintly lawyer, this incorruptible courtier, this humorous ascetic, this Roman Catholic who died for freedom of conscience at the hands of those who vaunted themselves its champions, strikes our imagination by his singularity as much as he touches our hearts by his simplicity.

More's only famous book is his *Utopia* published in Latin (1516), and translated into German (1524), Italian (1548), French (1550), and lastly by Robynson into English (1551). It begins by arguing, as Lord Campbell says, like Romilly or Mackintosh against indiscriminate severity in the punishment *e.g.* of theft when economical conditions caused theft. Those economical conditions were twofold—(1) the quantity of men "having no craft" as More styles them, and including priests, servingmen (our unproductive workers), gentlemen and noblemen, valiant and sturdy beggars, and most women (our unproductive consumers). (2) Men were being driven into theft by the turning of ploughland into sheep-runs and the consequent clearances. He thought this second tendency could be checked by penal statutes, and that penal statutes were stronger than the economic motive which in those days was called avarice; in this he erred in company with Latimer, Hales, and every writer of the time except W. Stafford (see Cunningham's *Growth of English Industry and Commerce*, 252, 268); the first evil he thought would be palliated by a law prescribing a maximum of wealth, but only cured by doing as in Utopia. Book 2 describes the island of Utopia (οὐ τόπος or εὐ τόπος, bad Greek for "Nowhere" or "Good Place") which is communistic. In Utopia all produce, except the very learned, who have a licence not to produce; and each producer alternates farm industry with some civic industry like building. As none are idle none are overworked, the normal working day being six hours, not nine hours, as a misprint copied from Robynson's 2nd edition of 1556 (where it is corrected in MS.) into Dr. Arber's, and the Camelot, Kelmscott, and other reprints indicates. Criminals work like *servi pœnæ* on the degraded but necessary tasks of killing animals for food, hunting, and scavengering. These are the only slaves in Utopia. Each has his task to do, and plenty of leisure and pleasure; and the criminal code, which does not apply to beliefs—as "it is no man's power to believe what he list"—is short and plain, so that criminals are fewer than in European commonwealths, which are "nothing but a certain conspiracy of rich men procuring their own commodities under the name and title of the commonwealth." The same rulers punish crime and prescribe tasks; but the latter is their main duty,—the former is easily and soon done. As Prof. Cliffe Leslie remarks, the economics of production always presuppose certain assumptions as to the consumer, a truth which was seen more clearly in the 16th century than by A. Smith and his successors. In More the productive machinery is simplified by assuming perfect and unchanging simplicity of taste in the consumer. Luxuries do not exist; and only implements of iron, which is held in high esteem, and earthenware are in common use. The (elected) king sets an example of sobriety to his subjects, and unlike the pretentious rulers of Bacon's *New Atlantis*—a book founded on *Utopia*—lives like a common citizen. Children are allowed to wear what we miscall "precious stones," but grown-up people spurn these baubles. Gold and silver, which are imported in exchange for the export of surplus products, and which for centuries afterwards were commonly deemed synonyms for wealth, are used in Utopia to fetter criminals or are formed into domestic utensils which shall be nameless, or in case of war are paid to foreign mercenaries. This is the only use for money by dwellers in Utopia; for, somewhat like Fichte in *The Closed Commercial State*, he makes the members of the nations barter with one another, and the nation carry on foreign trade by means of money, thus inverting the usual modern view. Exchange scarcely occasions any difficulty in such a simple state. Each district sends up to the capital statistics of supplies, which are then distributed by the state so as to make each district equal; and the district feeds, clothes, and houses its members. The capital stores up a reserve of supplies sufficient to tide over two years in case of emergency, or exports the residue in return for I.O.U.'s which are only realised when some purpose to which gold and silver are put in Utopia has to be fulfilled. The means of existence are always enough and more than enough for the population, whose numbers are kept down. It was the tendency in those times to think that numbers meant strength (Ingram's *History of Pol. Ec.*, p. 37). But in Utopia no town has more than 6000 families, and no family has more than sixteen members over thirteen years of age, for the families live patriarchally like More. Similarly with the farms. An excess over the prescribed limits means emigration, and emigration may mean war, for this sort of war is lawful. The other details of Utopia scarcely belong to political economy—the glass windows, the garden to each house (a suggestion expanded in Lytton's *Coming Race*, Bebel's *Position of Women*, and Morris's *News from Nowhere* into the identification of town and country), the priests, who are "of exceeding holiness and therefore few," always married, and sometimes female; the artificially-hatched chickens which

run after the men who hatched them; the absence of leagues and lawyers; the common dining-rooms in each street; the houses changed by lot every ten years and so on, somewhat as RUNDALE tenure. But the central conceptions are economic. He anticipates Sir Wm. PETTY in perceiving that wealth is the offspring of labour, and is still more modern in identifying it with necessaries, and he sees that necessaries imply a composite conception, *i.e.*, of what people ought to and do as a fact accept as such. Again the organisation of those who produce wealth with a view to its production with the least possible effort to the producer, and to the avoidance of waste, stamps the work as economical in its plan. His task is of course made easier by the ideal outline to the book; and by the assumption that communism will work. But it must be borne in mind that the ideal outline is filled in with practical details; he for instance alone amongst modern Utopians grapples with the crucial question of punishment; and secondly, unlike his model PLATO and his follower CAMPANELLA his communism is not pursued into family relationships, and those who complain that communism supplies no adequate incentive to work will find this objection raised by More at the end of book i., and the absence of an answer to it adverted to at the end of book ii. So far from being dogmatic, the conclusion of the matter is a note of interrogation. He ends and we end all but convinced. The book belongs more to literature than to science, and uses the actual only to decorate the ideal world. Like his life, the first part of his book grows out of the problems, and hardly rises above the ideas, of his age; the second part vividly reflects his character and takes us back to Plato, but also forward into the 19th century. It belongs to every age.

[J. Bonar, *Philosophy and Political Economy* (1893), pp. 62-67, 69, 290.—*Die Geschichte des Sozialismus*, edited by Bernstein and Kautsky, b. 1, th. 2, absch. 4 (vol. i. pp. 448 *et seq.*).—Diodato Lioy, *The Philosophy of Right*, translated by W. Hastie (1891), vol. i. pp. 262 *et seq.*—*The Dialogues of Plato*, translated by B. Jowett, 3rd ed. (1892), vol. iii. pp. ccxvii.-ccxxxi.—H. Morley's reprint of *Utopia*, Bacon's *New Atlantis*, and Campanella's *City of the Sun*, etc., entitled *Ideal Commonwealths* (1885).—*Voyage en Icarie*, by CABET (*q.v.*) (1840), which is an expansion of More's *Utopia*, but modifies several details, *e.g.* expulsion and not slavery is the penalty of idleness. The Nauvoo community formed in Illinois (1849) on the model of Cabet's book, was shifted to the banks of the Nodaway, Iowa (1860), and split into two parts (1879); the only prosperous part (Icaria-Speranza in California), consisted of fifty-two persons, but gradually reintroduced private property in 1883-84, and expired soon after. The other part was dying in 1883. Still, this is the most successful non-religious experiment in communism.—Dr. Albert Shaw, *Icaria* (1884), pp. 123, 147.—Dr. H. Lux, *Etienne Cabet und der Ikarische Communismus* (1894), p. 266.—For More's views on money cp. A. Smith, *Wealth of Nations*, iv. i., para. 4.] J. D. R.

MOREAU, CÉSAR (1791-1829):

French vice-consul in London, the founder of the *Société française de Statistique Universelle*, published numerous statistical works on French and English navigation in modern times enumerated in the (old) *Dictionnaire d'Économie Politique* and in Guérard, *France Littéraire*, 1834, vol. vi. p. 294. E. Ca.

MOREAU DE BEAUMONT, J. L. (1715-1785).

Successively councillor in the Paris parliament, master of requests and *Intendant des Finances*, was author of *Mémoires concernant les Impositions et Droits en Europe*, 4 vols. 4to, 1768-69, 2e éd., avec des Suppléments, 5 vols. 4to, 1787. The second and third volumes deal with France; in the preface of vol. i. the author expresses the opinion that in France uniformity of taxation "could alone put an end to the evils which were experienced, but that it is easier to see and feel the ills than to apply the remedy." Moreau's *Mémoires* (published anonymously) are mainly descriptive and considered to be authoritative on the subject as far as France is concerned.

[The reference to this work in A. Smith's letter to Mr. Sinclair, printed in Bonar's *Catalogue of the Library of A. Smith* (Macmillan, 1894), shows the writer's appreciation of it. A. Smith describes himself as having "frequent occasion to consult the book himself, both in the course of his private studies and in the business of his present employment (as Commissioner of Customs), and is therefore not very willing to let it go out of Edinburgh." He obtained it "by the particular favour of Mr. Turgot, the late Controller-General of the Finances. I have heard but of three other copies in Great Britain. . . . If any accident should happen to my book, the loss is perfectly irreparable." There are several quotations from Moreau de Beaumont in the *Wealth of Nations* referring principally to taxation in other nations of Europe. The use Adam Smith made of the book is a good illustration of his method of study and investigation, and the pains he took to master every detail of his subject. See also Stourm, *Dict. Hist. des Finances*, 1895, p. 25, who complains of the undue importance given to secondary matter.

Cunningham, *Econ. Jour.*, No. 1, vol. i., maintains that A. Smith's canons of taxation were largely derived from Moreau de Beaumont.] E. Ca.

MOREAU DE JONNÈS, ALEXANDRE (1778-1870), born at Rennes, died at Paris. A distinguished statistician, left many works important in their time, but now out of date. He volunteered as a soldier when fourteen years of age, was a prisoner in England from 1809 to 1815, and after the conclusion of peace devoted himself to statistics.

Thiers, minister of commerce, in 1834 appointed Moreau head of his statistical department, which through the periodical reports issued by him soon became one of the most important branches of the office. He continued this duty till 1852. Under his direction twelve huge quarto volumes were published in 1837 at the beginning of the second inquiry, which work, or at least the plan of it, may be considered as his. Besides this official collection, and not including his labours on physical science, the following works of his may be mentioned:—

Le commerce au XIXe siècle, 2 vols. 8vo, 1827.—*Statistique de l'Espagne*, 8vo, 1834.—*Statistique de la Grande Bretagne et de l'Irlande*, 2 vols. 8vo, 1838.—*Recherches statistiques sur l'esclavage colonial et sur les moyens de le supprimer*, 8vo, 1841.—*Éléments du Statistique*, 8vo, 1st ed. 1847, 2nd ed. 1876.—*Statistique de l'agriculture de la France*, 8vo, 1848.—*Statistique des peuples de l'antiquité*, 4 vols. 8vo, 1871.—*La France avant ses premiers habitans*, 16mo, 1876.—*Statistique de l'industrie de la France*, 16mo, 1876. A. C. f.

MOREL VINDÉ, CHARLES GILBERT, Vicomte de (1759-1842), a peer of France and member of the academy of science and royal society of agriculture, was a frequent writer on economic and agricultural subjects.

Considérations sur le morcellement de la pro-

priété territoriale en France, 8vo, 1826.—*Sur la théorie de la population*, 2nd ed. 8vo, 1829.

[A complete list of his works will be found under his name in Quérard, *La France Littéraire au 18me et au 19me siècle*, Paris, 1834.] E. Ca.

MORELLET, Abbé André (1727-1819), born at Lyons and died at Paris. Though an economist, he was not a physiocrat, inclining rather to the opinions of Gournay than to those of Quesnay, though always respectful to the latter.

He was by conviction a persistent partisan of freedom in economic matters, though he wrote no dogmatic work, but was constantly engaged in polemics attacking monopolies and privileges with arguments derived from practice. Hardships marked his youth. His father, a stationer in a small way, treated him with severity. There were thirteen brothers and sisters in the family. He early left his home and joined the Jesuits, from whom he received his first education. Persevering work and a bright intellect gained him admittance to the Société de Sorbonne, a private society endowed for the gratuitous reception of the deserving, no preference being shown to people of fortune or rank. He there became acquainted with many who afterwards became famous, the most illustrious of whom was Turgot. Like Adam Smith he had charge of the education of a young man of a wealthy family, to whose care he devoted ten years, five being at the Collège de Plessis. He raised both the standing and the numbers of that institution through his knowledge of the men of mark at that time, including a few foreigners, principally Italians.

Morellet discovered in a library at Rome a book on the legal practice of the church, written by an inquisitor of the 14th century. He made extracts from it, the outcome of which was the *Manuel des inquisiteurs*, which, in his time (1762), made a great stir. Voltaire was delighted with the book, and thenceforward held Abbé Morellet in high esteem, and amused himself by calling him Abbé *Mords-les*, because of his sarcastic and incisive style.

Morellet's first economic work was *Réfléxions sur les avantages de la libre fabrication et de l'usage des toiles peintes en France*, 12mo, 1758. The object was to secure freedom for the industry referred to in the interior of the country. Morellet did not go so far as to ask for free import of foreign goods. Probably he stopped lest he should alienate the *Compagnie des Indes*, with whom he was not yet prepared to quarrel. In the narrow limits of his *Mémoire* he gained a complete success. He introduced into France the most important work of Beccaria by a translation still in common use. Its appearance two years after the publication of the work itself (*Dei Delitti e delle Pene*) assisted in abolishing torture in France, partially in 1780, and completely nine years after.

Morellet's great triumph was the suspension of the privileges of the *Compagnie des Indes*, on 13th August 1769, in consequence of his *Mémoire sur la situation actuelle de la Compagnie des Indes*, Juin 1769. Necker, at that time only a clerk in a Swiss bank, took up the defence of the company in the form of a reply to Morellet.

The conflict with privileged commercial companies recommenced on the renewal of the monopoly of the Indian trade, to the advantage, if indeed it can be said to the advantage, of a new company in 1785. The impetuous Abbé wrote again in 1787, and re-edited the *Mémoires relatifs à la discussion du privilège de la Compagnie des Indes*, besides publishing a reply to Abbé d'Espagnac, the well-known stock-jobber of the 18th century.

The same year in which he was drawn into the controversy with the Indian company he published the *Prospectus d'un nouveau dictionnaire du commerce*, 8vo, a dictionary upon which he worked twenty years and then gave up. Peuchet profited by his work in his *Dictionnaire universel de géographie commerçante*, 5 vols. 4to, 1799-1800 (years vii.-viii.).

The translation by Diderot into French of the *Dialoghi sul commercio dei grani* of Abbé Galiani (*q.v.*), appeared in 1770. Morellet quickly took up his pen in the cause of freedom in the export trade. Unfortunately, error was more attractive than the plain truth, and with the public the Neapolitan Abbé had more success than his French fellow-economist. Morellet again took up arms for the same cause, this time against a writer whose celebrity was yet only dawning, though he had already crossed swords with him. Necker, in *La législation et le commerce des grains*, 8vo, 1775, argued against free trade. In an analysis of this work published in 8vo, 1775, Morellet showed all its weak points from the economic side. Again this time the victory was against Morellet.

The Revolution now commenced. It may well be believed that the Abbé did not lay down his pen, but with the exception of a refutation of a book on, or rather against, property, 1792, by the Girondin Brissot, who, anticipating Proudhon by half a century, held the opinion that property was robbery (*la propriété c'est le vol*), the works of Morellet at this date were political and literary. He died at the commencement of the restoration, aged ninety-two, not of old age, but by an accident. He was still in full possession of his mental faculties. Morellet's translation into French of the *Wealth of Nations*, though apparently carefully made, was never printed, see John Rae, *Life of Adam Smith*, 1895, p. 359. He mentions in his *Mémoires* that he met Adam Smith in Paris, and discussed free trade, banking, etc. with him, and that A. Smith spoke French very badly.

[Lavergne, *Les Économistes du xviiie siècle.*]

A. C. f.

MORELLY. Nothing certain is known of Morelly's life, except that he was born at Vitry-le-François, and was a teacher there. His works would have been as little known as he was, had it not been for the socialists who have extolled the communistic opinions they contain.

The first: *Le Prince, les délices du cœur, ou Traité des qualités d'un grand roi et système d'un*

sage gouvernement, 1751, 2 vols. 12mo, is entirely political, and describes in its different parts the duties of an absolute monarch.

The second: *Naufrage des îles flottantes ou la Basiliade de Pilpaï; poème héroïque traduit de l'indien*, 1753, 12mo, is a story in which the author declaims on the return to the state of nature in opposition to the state of civilisation. In his next work the author speaks modestly of this poem "as new in its subject as in the construction in which truth is reclothed in all the graces of epic poetry."

The third and last is: *Le Code de la nature ou le véritable esprit de ses lois, de tout temps négligé, méconnu*, 1758 and 1760, 12mo. This book, wrongly attributed to DIDEROT, is written in a dogmatic form. Property is abolished except in the case of things for personal use. The state supplies work and living to all, the first according to talents, strength, and age, the second according to needs. Inconsistently, like many communists, he is in favour of family life and marriage. Fourier has borrowed a great deal from Morelly. A. C. f.

MORGAN, AUGUSTUS DE (1806-1871), born at Madura, Madras, was the son of Colonel De Morgan and descended on his mother's side from James Dodson the mathematician. In 1823 he entered Trinity College, Cambridge, and came out as fourth wrangler in 1827. He was the first occupant of the chair of mathematics at University College, London, and held it for more than thirty years.

In 1838 De Morgan published his *Mathematical Treatise on the Theory of Probabilities*, and, subsequently, an *Essay* on the same subject, with especial reference to their *Application to Life Contingencies and Insurance Offices*. In 1847 appeared his *Formal Logic*, while from 1841 till shortly before his death he was closely occupied with the question of a *Decimal Coinage*.[1]

He proposed to make the change a very gradual one, by introducing *the royal*, a tenth of a sovereign, our florin, with its half and quarter, our shilling and sixpence. He then proposed to get the decimal part of this *royal* in the *groat*, a coin worth about 2½d., the tenth part of which would be approximately a *farthing*. A. L.

MORGAN, WILLIAM (1750-1833), nephew of Dr. PRICE (*q.v.*), whose works he edited with a memoir, occupied, as actuary to the Equitable Insurance Society (1775-1830), a leading place among the pioneers of life insurance. The aim of Morgan's financial pamphlets was to show that the war expenditure had added so enormously to the national debt that "if the same unexampled dissipation of the public treasure be continued much longer, it must inevitably terminate in bankruptcy and ruin."

His works include:—*The doctrine of annuities and assurances on lives and survivorships stated and explained*, London, 1779, 8vo.—*A Review of Dr. Price's writings on the subject of the finances of this Kingdom*, London, 1792, 8vo.—*Supplement* to above, London, 1795, 8vo.—*Facts respecting the expense of the War*, 4th ed. London, 1796, 8vo.—*An appeal to the people of Great Britain on the present alarming state of the Public Finances*, 3rd ed. London, 1797, 8vo.—*A comparative view of the Public Finances from the beginning to the close of the late Administration*, 3rd ed. London, 1801, 8vo.—*Supplement* to above, London, 1803, 8vo.—*A view of the rise and progress of the Equitable Society*, London, 1828, 8vo.

[For Morgan's actuarial work consult Walford's *Insurance Cyclopædia*, vol. ii. pp. 596-622, and vol. iii. pp. 5-7, for biographical details, *Dictionary of National Biography*, vol. xxxix. p. 40, and authorities there given.] H. E. E.

MORHOF, DANIEL GEORG (1639-1691). In his *Polyhistor* (published 1688) Morhof deplores that economics, which are nearly connected with political science, have been left to the care of *illiterati* and have not undergone a thorough scientific investigation, although they are the foundation of the well-being of the whole state. The means by which domestic wealth is increased and preserved ought to be closely examined, for "the preservation of economic wealth through a clever management is the basis of the entire science of economics and chrematistics." He recommends his readers to consult the books written by travellers, and is a great admirer of the internal administration of France.

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, pp. 328-329.] E. Ca.

MORPURGO, EMILIO (1836-1889), born in Padua, an able economic writer. He took part in politics, was a deputy, general secretary of public instruction, and devoted to practical problems in Italian economics, finance, and instruction. He also occupied himself with science and instruction, and filled, with much distinction, for many years, the chair of statistics in Padua. Amongst his practical works, his *Report on the Condition of the Peasants and Agriculture in the Venetian Provinces*, made on the occasion of the agrarian inquiry, takes a

[1] De Morgan bestowed a vast amount of unrewarded time and trouble on the propaganda of views in favour of a reform of the English system of money to a decimal system of currency and notation. He laboured incessantly with this view by giving evidence before parliamentary committees, in lectures to various scientific bodies, and in the Decimal Association (vide article DECIMAL SYSTEM). The particular method he advocated was the "pound and mil" scheme, retaining our pound sterling and subdividing it into 1000 instead of, as at present, 960 farthings. De Morgan may be fairly said to have been, taken all round, one of the best appreciated and esteemed men of his position in the past generation. In tuition and in literary matters, his versatile aid and almost boundless store of information were liberally given. Painstaking and minute research was his strong point. He had lost the sight of one eye in infancy. The strain upon the remaining eye, involved by his constant industry in accumulating stores of knowledge, must have been severe. The writer once had occasion, in a letter to him, to mention one of the Bernoulli family of mathematicians of the last century, and spelt the name wrongly, that is with two i's, Bernouilli. "Oh," replied De Morgan, "you have deeply offended me. Pray always keep in mind the personal interest I take in one-eyed philosophers." F. H.

high place. This work is a model of its kind for method, for accuracy, and the ideas embodied.

Morpurgo studied the practical problems of finance and the organisation of technical instruction in Italy. His scientific activity was chiefly applied to statistics, on which subject he has left deep traces by his remarkable studies of demographic, financial, and moral statistics, and also in his historical and theoretical researches. His most important work in this branch of study is a volume on statistics and moral sciences, in which he collects and states the principal results of modern statistical research. We note among Morpurgo's writings: *La statistica e le scienze morali*, Florence, 1872.—*L'istruzione tecnica in Italia*, Rome, 1874.—*La finanza*, Rome, 1876.—*Le condizioni dei contadini e le condizioni della proprietà e dell' economia agraria nel Veneto*, in the "Atti dell' Inchiesta Agraria," vol. iv., fasc° 1 and 2, Rome, 1882-83. U. R.

MORRIS, Corbyn (d. 1779), writer on fiscal subjects, held various posts in the public service in Scotland and in England, and was an upholder of the mercantile theory. He attracted attention by a pamphlet entitled *A Letter from a Bystander to a Member of Parliament*, in which he examines the economic basis of the crown. This letter provoked a sharp controversy in print: replies and counter-replies embody "much curious discussion and information with respect to taxation and the expenditure of the public revenue for a lengthened period" (M'Culloch, *Lit. Pol. Econ.*, p. 328). Morris also urged the impolicy of England's insuring the ships of a nation (*i.e.* France) with which she was at war: his papers on this subject carefully examine the arguments on the other side, and hypothetical problems are worked out in detail. In his *Essay* on Insurance, the author candidly states that in working out the subject he started not from ascertained facts but from reflections of his own, and that these last did not accord with the views of "a very ingenious and worthy merchant" to whom he had communicated them. The reader is to expect "no information concerning what are the present customs . . . but . . . an endeavour to establish the just maxims . . . upon a fair open footing of reason and equity." He adds that in working out insurance problems he soon found, as was not unnatural in a Cambridge man, that "without the aid of some higher calculations," *i.e.* of mathematics, "all must be left unsettled and loose, and bounded by general guesses." Hence his problems are stated and worked quite on mathematical lines. In 1751 he published some vital statistics concerning London, and a little later urged the establishment of a national registry-general of the population, and of the annual proportion of births to deaths. His statistical work on London was reprinted and brought nearly up to date in 1759. The scarcity of silver coin in England at that time also attracted Morris's attention, and by working out the respective values of existing gold and silver coin as bullion, he arrived at the conclusion that silver was scarce in England because the existing proportion of pure gold to pure silver was as $1 : 15\frac{2}{1}\frac{8}{8}\frac{5}{4}\frac{0}{8}$, whereas in the other chief trading countries of Europe it was as $1 : 14\frac{1}{2}$; and that there was consequently a temptation to export silver abroad, the gross profit upon 100 lbs. troy weight of gold being some $40\frac{1}{2}$ per cent. The remedy, in Morris's eyes, was to alter the English ratio of gold to silver to the continental figures. His plan for account-keeping on landed estates grew out of his own need of something better than his steward's rather haphazard method of checking rents, etc.

The following works seem all to have been published in London:

A Letter from a Bystander to a Member of Parliament, wherein is examined what Necessity there is for the Maintenance of a large regular Land-force in this Island, etc., London, 1741-42, 8vo.—*An Essay towards illustrating the Science of Insurance, wherein it is attempted to fix, by precise Calculation, several important Maxims upon this Subject*, etc., 1747, 8vo, pp. xv. 61.—*An Essay towards deciding the Important Question whether it be a National Advantage to Britain to Insure the Ships of her Enemies; addressed to the Rt. Hon. Henry Pelham*, 1747, 8vo, pp. 50; the impolicy and illegality of the practice are clearly shown; 2nd edit. 1758, pp. x. 34.—*Observations of the Past Growth . . . of the City of London*, 1751, fol.—Ditto reprinted, and with statistics to the end of 1757, 1759, 4to.—*A Letter balancing the Causes of the present Scarcity of our Silver Coin, and the Means of immediate Remedy, and future Prevention of this Evil*, 1757, 8vo, pp. 20.—*A Plan for Arranging and Balancing the Accounts of Landed Estates*, 1759, fol. pp. 39.

[M'Culloch, *Lit. Pol. Econ.*, pp. 243, 272, 327.—*Dict. Nat. Biog.*, art. "Morris, Corbyn."]

E. D.

MORSTADT, Eduard (1792-1850), professor at the university of Heidelberg, lectured on economics, finance, and law, and founded, in 1834, a monthly paper, *Der Nationalökonom*, of which he remained the editor until the end of the following year.

Morstadt published a German translation of Say's *Cours d'Économie Politique*, with an introduction in which he defines political economy: "a science whose real object must not be to dictate oracles to her high priests when sitting under their nocturnal lamp, but is to become the confidant of princes, the teacher of nations, and the interpreter of universal history." A supporter of free trade and an opponent of restrictive legislation of labour, he was very fond of delivering himself of curious economic definitions (see under his name, Prof. Conrad's *Handw. der Staatswiss.*, iv. p. 1230), and of editing other writers' works with critical notes; on the occasion of such an edition

of Klüber's *Public Law of the German Confederation*, he was most unmercifully handled by Robert von MOHL, his colleague and former contributor. His own contributions to the *Nationalökonom.* are all very short; his analysis of the three possible courses of action which a government is able to follow with regard to population, is given in the already mentioned article of Professor Conrad's *Handwörterbuch.* E. Ca.

MORTGAGE (= *dead pledge* — as distinguished from *vif gage* = living pledge, *i.e.* a pledge taken into the creditor's possession and producing income which gradually pays off the debt) is the name of a security given by a debtor on property remaining in his possession—the hypotheca of Roman Law—and thus differing from a security on property handed over to the creditor, which is described by the name of "pawn" or "pledge," the *pignus* of Roman law. In the case of a "legal mortgage" the legal ownership is expressed to be conveyed to the creditor, on condition that on repayment of the debt before a certain date, it is to be reconveyed to the debtor, but, owing to the influence of the equitable doctrines introduced by the Court of Chancery, the debtor's right to redeem —generally called the EQUITY OF REDEMPTION —continues, although the date for repayment has elapsed and cannot be taken away except by an order of the court (called a FORECLOSURE order) which is not made absolute for some time.

In the event of the mortgagor not complying with the conditions of the mortgage there are other remedies open to the mortgagor besides foreclosure. He may, unless the mortgage deed contains any stipulations to the contrary, sell the property, or have a receiver of the rents and profits appointed, or he may enter into possession, and he may also enforce the debtor's personal liability to pay the mortgage debt.

Mortgages of land and houses occur most frequently, but mortgages of debts, reversionary interests, life policies, and other "choses in action" are also very common. Mortgages of chattels being deemed bills of sale (see BILL OF SALE), are void if they are intended to secure a debt of less than £30, and must in other cases conform to the statutory rules as regards form and registration.

An "equitable" mortgage is a transaction which in certain events entitles the mortgagee to the execution of a legal mortgage, and practically entitles him to all the remedies open to a legal mortgagee. There is, however, this difference, that a "legal" mortgagee having no notice of a prior charge at the time of lending the money, has the first right on the security, whilst the priorities between "equitable" incumbrances depend entirely on the order in which the respective advances were made. The most common instance of an equitable mortgage is a mortgage by "deposit of title deeds" which is deemed to be an agreement on the part of the mortgagor to execute a legal mortgage whenever called upon to do so.

A "submortgage" is the mortgage of a mortgage debt and of the securities relating to the same; a "contributory" mortgage is a mortgage by several mortgagees, each being entitled to an aliquot share of the mortgage deed.

[As to Mortgages by Companies, see DEBENTURE. Coote, on *Mortgages.* — Ashburner, on *Mortgages.*] E. S.

MORTGAGE BANKS. Banks and other public institutions whose only business it is to lend money on mortgage, are much more common on the continent than in England—Germany being the country in which they have attained the greatest importance. They may be divided into three classes: (1) Mutual associations of landowners (*Landschaften*, *Kreditvereine*, etc.); (2) Mortgage institutions administered by government, or provincial or other local authorities (*Landes Kreditkassen*, *Provinzialbanken*, etc.); (3) Ordinary joint-stock banks.

The first landowners' association was established in Silesia by Frederick the Great, soon after the end of the seven years' war (1756-1763), which caused much distress in that province. The large landowners of the province were compelled to join it, and they were all jointly and severally liable for the mortgage bonds (*Pfandbrief*) issued by the association. Every member was entitled to raise loans on mortgage up to a certain amount, the borrower receiving mortgage bonds instead of money. It was, however, easy to dispose of their bonds, as owing to the excellent security which they gave to the holders they soon became a favourite investment.

No profit was to be made on the transactions of the association, the interest on the mortgages being only slightly higher than the interest on the bonds, so as to allow for expenses of management. The supreme control of the association was exercised by a government commissioner—generally by the governor of the province.

The success of the Silesian association soon led to the formation of other similar ones in other Prussian provinces, and, in course of time, associations of peasant proprietors were founded in some places on analogous principles. There are now nineteen such associations in Prussia, among which the one for the province of Schleswig Holstein, founded in 1882, is the youngest, and there are four in other parts of Germany. Outside of Germany they exist in Austria-Hungary, and, in a modified form, in the rural parts of the canton of Zurich (*Garantiegenossenschaften*).

(2) The above-mentioned associations are mainly adapted for loans to large landowners, whose joint credit is sufficient to enable them to issue their bonds at a relatively low rate of interest; the peasant proprietors' associations do not have the same advantages, and are only available in limited areas. For this reason the intervention of government and local authorities was generally felt as a necessity, more especially in those parts of Germany where it is customary for one son to

take over the father's property, and to pay a money compensation to his brothers and sisters for their share in the estate. The first impulse to the institution of state establishments for the purpose of granting loans to landowners was given by the legislation for the compulsory enfranchisement of land subject to manorial rights, which in most parts of Germany, though initiated at the beginning of the present century, did not become effective till about 1850. In order to facilitate the payment of compensation to the lords of manors, loans were granted by the state governments or provincial governments on the security of the enfranchised land, and this led to the establishment of a regular system of government mortgage banks. Such banks exist in many parts of Prussia and other parts of Germany, and the total amount advanced by them in 1889 amounted to about 418,000,000 marks (21,000,000 sterling). Most of the loans granted by these institutions are repayable by yearly instalments. A curious combination of government and private agency exists in Mannheim, where the *Rheinische Hypothekenbank*—an ordinary joint-stock bank,—has a separate department for loans on agricultural property, which by virtue of a convention with the government of the grand-duchy of Baden must be carried on without profit, and is under government supervision. Government banks also exist in Austria and Russia.

In the United Kingdom advances by public authorities on land occur in various manners. The advances under the Irish Land Purchase Acts and the Irish Land Act 1903 (see LAND LEGISLATION, IRISH) are for purposes similar to those for which the German state loan institutions were originally established; the public works' loan commissioners are entitled to advance money on the security of land for the purpose of constructing dwellings for the working classes (Housing of Working Classes Act, 1890, § 67), and the provisions of the Small Holdings Act, 1892, under which county councils are empowered on the sale of any small holdings to allow part of the purchase money to be paid by instalments, and in the meantime to be charged on the land, also require to be mentioned in this connection.

Special facilities have been given in continental countries as well as in the United Kingdom for loans in respect of the improvement and drainage of land. In Germany, special banks (*Landesculturrentenbanken*) were instituted either as government establishments, as in Saxony, Bavaria, and Hesse, or under the provincial authorities. Loans granted for these purposes are in most cases specially secured and are repayable by fixed instalments.

In England and Scotland advances may be made out of public funds with the sanction of the board of agriculture, and are secured by terminable rent-charges by means of which the capital is paid off in twenty-two years. Such rent-charges may be created notwithstanding any settlements or entails (see the Public Money Drainage Act, 1846, and the amending acts). Similar powers are given to the commissioners of public works in Ireland by the Landed Property Improvement (Ireland) Acts.

(3) The authorities and institutions mentioned under the two first heads make their advances for public purposes and not with any view of profit, but there are numerous establishments, partly competing with them, and partly supplementing them, which are in a position to make advances on terms not less advantageous than they, and yet are able to pay dividends to their shareholders. The first mortgage bank was established in Stockholm in 1668, but its example does not seem to have been followed at the time; 1835 a *Caisse hypothécaire* was formed in Brussels, but the first institution formed on the modern system (viz. that of a share company issuing debentures for an amount corresponding to the amount of the mortgages held by it) was the *Crédit foncier de France*, founded in 1852 under government supervision. In Germany a number of banks on the same system were formed after 1860: the Bavarian Mortgage Bank was founded in 1834, but did not begin to issue debentures till much later. The capital of these banks at the beginning of 1891 amounted to 332 million marks (£16½ million), and the debentures issued by them to over 3000 million (£150 million). Their 3½ per cent debentures are generally quoted over par. There are also such mortgage banks in Austria-Hungary, Switzerland, and Italy. In the latter country a new privileged institution was founded in 1890 (*Istituto italiano di credito fondiario*). The Argentine mortgage banks, and more especially the provincial ones, are but too well known in this country.

In the United Kingdom it had been expected that the Mortgage Debenture Act of 1865, and the Mortgage Debenture (Amendment) Act of 1870 (28 & 29 Vict. c. 78; 33 & 34 Vict. c. 20) might assist landowners, and on the other hand provide sound investments for capitalists; but the result was very disappointing. The acts provide that the securities upon which debentures issued under their authority may be founded are to belong to certain special descriptions, and are to be deposited and registered in the office of land registry, and to be accompanied by a statutory declaration of a surveyor as to the value of the mortgaged properties, and contain other safeguards in favour of the debenture holders, but the precautions imposed have not proved very effective, and the only important company which availed itself of the provisions of the acts in question was recently compelled to go into liquidation.

The question as to the economical advantages and disadvantages of the various forms of mortgage banks cannot well be discussed in general terms, as the answer depends on the local circumstances, of which there is an infinite variety. The great danger of special facilities for mortgaging land arises in times of inflation, when they multiply the opportunities for reckless gambling; on the other hand it is an advantage that there should be special financial institutions for the purpose of making advances on real property, as it is clearly not within the province of ordinary banks to lock up any substantial part of their funds in such advances.

Where there are numerous small holders, the intervention of the public authorities is almost a

necessity, as it would not pay establishments carrying on business on strictly commercial principles to lend small sums except on very onerous terms. Several proposals for Land Mortgage Banks have recently (1912) been made, but none have yet been established.

[As to continental mortgage banks, see Buchenberger, *Agrarwesen und Agrarpolitik*, ii. 97-190.—Hecht, *Die Staatlichen und provinziellen Bodenkreditinstitute in Deutschland;* and arts. "Landschaften," and "Hypothekenaktienbanken," in *Handwörterbuch der Staatswissenschaften.*—H. W. Wolff, *People's Banks*, 1896; *Agricultural Banks; Co-operative Banking*, 1907.—Palgrave, arts. in *Banker's Magazine;* "Banking in Italy," 1909; "People's Banks," "Agricultural Land Banks," "Land Banks in France," 1910; "Banks to facilitate the purchase of Land," 1911;—also BANKS, POPULAR, in Vol. I.] E. S.

MORTGAGE BOND. Bonds issued by a railway or other corporation are sometimes secured by the mortgage of some particular assets or assigned property. American railroad companies have floated many mortgage bonds on the London market, besides income bonds which are practically preference capital. A. E.

MORTGAGE DEBENTURE. A debenture secured by a mortgage of property. The use of the word does not, however, in itself give any rights to the holder, and may therefore in many cases be misleading (see DEBENTURE). E. S.

MORTGAGEE. A creditor secured by a MORTGAGE (*q.v.*) of property. E. S.

MORTGAGES, REGISTRATION OF. The compulsory registration of mortgages in a public register is much more universal than the registration of land or deeds affecting land generally (as to which see LAND REGISTRATION). Thus in many places mortgages of land are not effective unless registered, although there is no similar requirement as regards transfers of property (*e.g.* the Argentine Republic). The reason for this is that the publicity of mortgages is desirable to avoid disputes as to title, and to prevent people obtaining credit by the apparent ownership of property not really available for their general creditors. As in England mortgages may be effected of movable property as well as of land, a safeguard was required for the former, and this explains the reason of the statutes requiring the registration of a BILL OF SALE (*q.v.*), which, however, exclude the bills of sale of limited companies. A mortgage granted by a company is void against the liquidator and any creditor of the company, unless registered in the prescribed manner (Companies Act 1900, § 14). A mortgage of land registered under the Land Transfer Acts 1875 and 1897 is ineffectual unless protected by the registration of a charge, or of a caution or restriction, or by the deposit of the land certificate.

[Morris, *A Summary of the Law of Land and Mortgage Registration*, 1895.—Reports on the systems of registration of title in Germany and Austro-Hungary, 1896 (c. 8139); and 1897 (c. 8319).—Jennings and Kindersley, *Land Registration under the Land Transfer Acts 1875 and 1897* (1904).)] E. S.

MORTGAGOR. A debtor who charges property by way of MORTGAGE (*q.v.*). E. S.

MORTIMER, THOMAS (1730-1810), a voluminous author and compiler, the merits of whose work cannot quite be taken at his own valuation, was appointed in 1762 English vice-consul to the Austrian Netherlands. In 1765 he translated NECKER'S work *On the Administration of the finances of France*, 3 vols., 8vo. Mortimer's most important work, the *Elements of Commerce, Politics, and Finance*, 4to, in three treatises on these important subjects, designed as a supplement to the education of British youth after they quit the public universities or private academies, appeared in 1772. On the BALANCE OF TRADE (*q.v.*) Mortimer claims to have originated the theory that it depends on the amount of the total commerce carried on to all quarters of the world. The portion on finance, while strenuously combating "idle notions of refunding the capital" of the national debt, contains some acute criticism of Dr. PRICE'S views on a SINKING FUND (*q.v.*). In an advertisement, prefixed to a reprint of the book in 1780, Mortimer roundly accused Adam SMITH of having plagiarised from him, and claims that the *Elements* had helped to put a stop to fictitious insurances at Lloyds, and had suggested to Lord NORTH the taxing of certain luxuries, and to Lord Beauchamp his bill for the prevention of arrests for debt for sums under £10. The *Elements* exhausted Mortimer's attempts at original work; for the rest of his life he was busy with work for the booksellers. In his old age he complained to Isaac Disraeli of the hardships of his position.

Among Mortimer's other works were: *Every man his own Broker, or a Guide to Exchange Alley*, London, 1761, 12mo, 13th ed., 1801.—*The Universal Director*, London, 1763, 8vo.—*Dictionary of Trade and Commerce*, 2 vols., London, 1766, 4to.—*Student's Pocket Dictionary*, London, 1777, 12mo.—*General Commercial Dictionary*, London, 1810, 8vo.—*A Grammar illustrating the Principles of Trade and Commerce*, London, 1810, 12mo.—*Nefarious practice of Stock-jobbing unveiled*, London, 1810, 8vo.

[*European Magazine*, vol. xxxv.—*Dictionary of National Biography*, vol. xxxix.—M'Culloch's *Literature of Pol. Economy*, pp. 52, 53.] H. E. E.

MORTMAIN. Under the feudal system the lord who had a corporation for tenant was under considerable disadvantages. His tenant could not die, could not marry, be a minor, or commit a felony: thus a great part of the lord's profits were taken away. In addition to this, the great religious corporations, such as the templars, held royal charters granting them further immunities. The matter was made worse by a

practice which grew up during the 12th century: a tenant would alienate his land to a monastery and be received back as a tenant of the monastery, thus depriving his original feudal lord of his rights. This last process was declared illegal by the great charter of 1217. A clause of the abortive provisions of Westminster, A.D. 1259, which was re-enacted in the statute De Viris Religiosis, generally known as the Statute of Mortmain, in 1279, made all alienations to the church illegal, whether made in FRANKALMOIGN or otherwise, without the lord's consent. According to later statutes an inquisition, *ad quod damnum*, had to be held, and it was only after this inquisition had shown that neither the king nor any one else would suffer loss thereby, that an alienation to the church was allowed. Apparently it was not till near the end of the 14th century that it was discovered that any corporation was as bad a tenant as the church; for it was not till the statute of 15 Richard II., A.D. 1391, that alienation to any corporate body was subjected to the same laws as alienation to the church.

[*Statutes of the Realm.*—Pollock and Maitland, *History of English Law*, Cambridge, 1895.]

A. E. S.

MORTON'S FORK.[1] This was a dilemma devised by Bishop Morton, chancellor under Henry VII., afterwards cardinal and archbishop of Canterbury, to swell the contributions to a Benevolence (see BENEVOLENCES), levied for a proposed war with France (1491). A clause was inserted in the instructions to the commissioners: "That if they met with any that were sparing, they should tell them that they must needs have, because they laid up; and if they were spenders, they must needs have, because it was seen in their port and manner of living."

[Bacon, *History of the Reign of King Henry VII.* (ed. Lumby), p. 93.]

R. L.

MOS (custom). "Jus quod moribus constitutum est" is customary law, which is opposed to "lex" statute law (see Smith's *Dict. of Antiquities*, art. Jus).

E. A. W.

MÖSER, JUSTUS (1720-1794) was born at Osnabrück, where his father held a high legal office. He studied at Jena and Göttingen from 1740 to 1742, and, afterwards practising as an advocate in his native place, won the esteem and confidence of his fellow-citizens, which he retained in several important public positions which he filled.

ROSCHER, who declares *him*, and not Hugo or Schlosser, to have been the father of the historical school of law—a judgment which is, however, not generally accepted,—pronounces him also the greatest German political economist of the 18th century, and this on the ground of his possession of the following qualities:—(1) his open sense, equally for the higher social facts and for the homely every-day life of communities; (2) his thorough acquaintance with, and warm feeling towards, the people, in both senses of that word—the lower classes, and the nation at large; and (3) his mastery of HISTORICAL METHOD. He has not put forward any *system* of political economy, but his very numerous writings abound in original economic ideas, scattered through them, as Goethe says, like gold nuggets and gold grains. He shows himself to us as a sound-hearted, healthy-minded man, somewhat wayward and paradoxical in his mental habits, and "old world" in his views. He is opposed to the "liberal-rationalistic" school of Adam SMITH, dislikes the highly developed division of labour, objects to generalising and centralising tendencies, and looks with admiration and affection on many institutions of the feudal period. It was well that justice should be done to the merits of that age, but, in showing that the principles and practice of the past suited the contemporary social environment, he is sometimes led, like most lovers of antiquity, to represent them as adapted to the present, when they are really and necessarily obsolete and incapable of revival.

How strongly Möser impressed Goethe, and what an influence he had upon his youth, may be seen in bk. xiii. of the *Wahrheit und Dichtung*. His principal work, which takes rank as a German classic, is his *Patriotische Fantasieen*, 3 pts., 1774-1778, a series of short essays, which in many respects remind the reader of Franklin.

[Wegele in *Allg. Deutsche Biogr.*—Schmidt in *Handw. der Staatswissenschaften.*—Roscher, *Gesch. der N. O.*, p. 500.—Cohn, *Hist. of Pol. Econ.* (see arts. on CAMERALISTIC SCIENCE; GERMAN SCHOOL).]

J. K. I.

MOSER, FRIEDRICH KARL VON (1723-1798), after having studied law at Jena, and been some time engaged in tuition, successively entered into the civil service of several German princes, but roused a vindictive animosity against himself by his bold denunciations of the official exactions committed in the small German states. His outspokenness led to his being sentenced in 1780, by the faculty of law in Frankfurt-on-the-Oder, to six years' imprisonment in a fortress, and a fine of 20,000 florins. He however, succeeded in evading actual imprisonment.

He was a frequent and fragmentary writer on diplomacy and public law, but is best known by his book *Der Herr und der Diener, geschildert mit patriotischer Freiheit* (The Master and the Servant depicted with patriotic Freedom), 1759, in which he declares that "times are near when the choice will not be between good and bad, but between bad and worse," and professes to be ashamed to be a German, when he thinks "what kind of men most of the heirs presumptive will be."

[1] Morton's connection with this dilemma has been controverted. Bacon, *History of King Henry VII.*, speaks of it as "a tradition."

Although he manfully struggles against the narrow and selfish *Particularismus* of the German princes, he is not a follower of the French philosophers, but finds in St. Paul's remarks in the *Epistle to the Romans* on the powers that be, a right exposition of the duties of the subject; he praises Mirabeau the elder, but denies that there only exists one model of a good government. His own leanings are in favour of the state of things anterior to the Thirty Years' War.

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, pp. 529-532.—Bluntschli, *Gesch. des allg. Staatsrechts*, pp. 404-413.] E. Ca.

MOSER, Johann Jacob (1701-1785), had as chequered an existence as his son Friedrich von Moser (*q.v.*). A man of great classical attainments, he was successively a lawyer, a university professor at Tubingen and Frankfurt-on-the-Oder, a member of the government of Wurtemberg and other German states, and founded an academy for political science in Hanau. His unguarded language in defence of the rights of the *Landstände* of Wurtemberg against their domineering duke got him into trouble, and he was imprisoned for six years (1758-1764).

He wrote about 400 volumes and pamphlets, and is considered as the founder of the science of German public law. He published a *Bibliothek von oekonomischen und Cameral Polizei-schriften* (Ulm, 1758), and some dissertations on economic questions; in his autobiography, he states that for a long time, cameralistics and the science of interior state policy had been his favourite studies. Roscher expressly mentions his *Grundsätze einer vernünftigen Regierungskunst nach der jetzigen Denkungsart . . . verständiger Regenten* (Principles of a rational art of Government according to the opinions and practice of intelligent Rulers), 1753, in which Moser designs to demonstrate that trade, the interior state policy, etc., form "a connected and systematic whole." As announced by its title, this book is an exposition of what was done in well ruled states of these times (England and France being often put up as examples), but abstains from doctrinal investigations of what ought to be. Although Moser had some quarrels with Friedrich Wilhelm I. of Prussia, he derives a good number of the "principles" he recommends from this king's policy.

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, pp. 441-443.—R. von Mohl, *Literatur der Staatswissenschaften*, ii. pp. 401-412.—Bluntschli, *Allgem. Staatsrecht*, 2nd ed. p. 402.] E. Ca.

MOSSE or MOSES, Miles (fl. 1580-1614), divine, was the author of *The Arraignment and Conviction of Usury*, London, 1595, which may be taken as a representative statement of the more liberal church view of usury (see Interest and Usury) at the close of the 16th century. Mosse distinguishes between the sin of usury and usury itself.

[Ashley's *Economic History*, vol. i. pt. 2, p. 469, London, 1893, 8vo.—*Dictionary of National Biography*, vol. xxxix. p. 184.] H. E. E.

MOST FAVOURED NATION CLAUSE. This is inserted in many commercial treaties. It binds each of the contracting powers to give to the other in certain matters the same treatment which it gives or may hereafter give to the nation which receives from it the most favourable terms in respect of those matters. The nature of such stipulations will be understood from the following example, taken from a convention on trade-marks concluded between Great Britain and the United States in 1878.—"The citizens of each of the contracting parties shall have, in the dominions and possessions of the other, the same rights as belong to native subjects or citizens, or as are now granted or may hereafter be granted to the subjects and citizens of the most favoured nation, in everything relating to trade-marks and trade-labels" The concession here is strictly limited as to its subject matter; but in many cases the most favoured nation clause is made general in its terms, and covers all matters of trade and navigation. When such large expressions are used it sometimes happens that a state finds itself called upon to grant to a distant or unfriendly power, or even to a keen commercial rival, privileges it has given for valuable consideration to a friend and neighbour. Nations who have adopted protectionist theories of international trade are likely to find themselves in this predicament more often than those who are content to let commerce take its course without attempting to control it in their own interests by constant higgling with other powers. The inconvenience of having to give to one set of foreigners concessions for which a valuable equivalent has been extorted from another set has been avoided by means of the doctrine that the most favoured nation clause applies only to concessions which are gratuitous, and does not entitle the party which claims under it to privileges which some other state has gained by giving corresponding privileges in return, unless the claimant also is content to offer a fair consideration for them. It can hardly be said that this is a rule of international law; but it has been adopted in such a large number of cases that a state which acts upon it cannot be accused of bad faith.

English commercial treaties containing a most favoured nation clause will be found in Hertslet's *Treaties*. The view of the meaning of the clause enunciated above is explained and defended in Wharton's *International Law Digest* (§ 134). T. J. L.

MOTIVES, Measurable. A term suggested by Professor Marshall as offering one way of marking off the sphere of economics from that of other social investigations. Motives are measurable so far as they can be relied on to produce constant effects which can be quantitatively estimated. Again measurable motives can be balanced one against another, as when we estimate the amount of sacrifice a person is willing to undergo in order to procure a given

utility. Here the sacrifice and utility have both to be expressed in objective form before they can be economically measured. This is possible only when objects of desire or aversion can be freely transferred by contract between individual and individual. It is because economics deals primarily with such objects that the science has assumed a greater precision and exactness than any other social science. This characteristic has made it possible to examine economic phenomena by abstract, deductive, and, even to some extent, mathematical methods. W. E. J.

MOVABLES. Things which from their nature are capable of being moved from one place to another. The classification of things into movables and immovables is the only classification that corresponds with an essential difference in the subject matter. A leading distinction between movable and immovable property is that as to the latter, according to English law, the rules of inheritance follow the *lex situs*, while as to the former they follow the *lex domicilii*. The *lex situs* decides whether an article is a movable or not.

[Sir Henry Maine in *Ancient Law*, London, 1880, traces the gradual development of the distinction in Roman law.] J. E. C. M.

MÜLLER, Adam Heinrich (1779-1829), was born at Berlin. In his nineteenth year he went to the university of Göttingen, where he at first occupied himself with theology, and then became a student of jurisprudence, in which he was a pupil of Hugo. He afterwards sought to complete his education by the private study of the natural sciences, which he had previously neglected. He early formed a close intimacy with Friedrich Gentz, his elder by fifteen years; and this connection exercised an important influence both on his material circumstances and his mental development in after life. The two men differed widely in character and in their fundamental principles, but agreed, at least in their later period, in their practical political aims, and the friendship between them was brought to an end only by Müller's death. The relations of the latter with the Junker party, and his co-operation with them in their opposition to Hardenberg's reforms, made any public employment in Prussia impossible for him. In 1805 he was in Vienna, where he became a convert to Roman Catholicism, and, through Gentz, was brought into relations with Metternich, to whom he was useful in the preparation of state papers. He spent the years 1806-1809 in Dresden, being occupied in the political education of Prince Bernhard of Saxe-Weimar. In 1813 he entered the Austrian service, and in 1815 accompanied the allies to Paris; he was ennobled by the emperor in 1820. In 1827 he settled a second time in Vienna, and was employed in the state chancellery. He was one of the principal literary instruments of the reaction, and took part, as Gentz's assistant, in framing the Carlsbad resolutions.

He was a man of remarkable powers and of great versatility, a born orator, and distinguished as a writer, not only on politics and economics, but on literature and æsthetics. As Gentz said of him: "He impresses us with a sense of his superiority even when we believe him to be on a wrong path." His principal work is his *Elemente der Staatskunst* (1809), which contains the substance of a course of lectures which he delivered at Dresden before a number of statesmen and diplomatists. He was, along with Gentz and Haller, a member of the school of politicians and economists in Germany, which has been called the romantic, as harmonising in spirit with the literary school of Tieck, Schlegel, and Novalis, and looking back with admiration and regret to the church and state of mediæval times. In political economy he represents a reaction against the doctrines of Adam Smith, whom, whilst he highly commends him in certain respects, he censures as presenting a one-sidedly material and individualistic conception of society, and as being too exclusively English in his views. Müller's leading idea is that of the organic unity and continuity of the state and of social institutions in general—a principle for which he may have been in part indebted to Burke, whose *Reflections* were translated by Gentz. The economy of a society, he holds, is something more than the sum of the private economies of its members; the individual must always be regarded in relation and subordination to the community. The capital of a country is not material only; its language and culture, its character and experience, its laws and constitution, are true portions of the national wealth. The state is not merely a mechanism for the maintenance of order and the administration of justice; it represents all the physical and spiritual possessions and requirements of the nation, and ought to bind together the whole inner and outer life of the people into a harmonious and energetic unity. Not merely should it study present production and immediate gain, but keep before it the increase of productive power and the development of civilisation in the future, and preserve for coming generations their entire inheritance, intellectual, moral, and economic. Müller considers Smith's theory of the division of labour defective in not sufficiently emphasising the dependence of such division on capital—on the labours and acquisitions of the past—and sets beside it, by way of correction and completion, a theory of the national combination of labour as no less important, though little more than indicated by Smith. The practical system of Smith might suit England sufficiently well, because the spiritual and material life of the people rested on a firm basis of traditional sentiments and old institutions reaching back to

the middle ages, which continued to keep alive national self-consciousness and knit together the several social classes in a healthy union. But the ends thus spontaneously attained must, in continental countries, be affected by governmental action steadily maintaining the national idea and systematically developing the productive powers and general energies of the nation. In the economic sphere, he defends a policy of restrictions on importation as one means towards this development.

Müller's strength lies in breadth and comprehensiveness; his defect in want of definiteness of conception and expression. Notwithstanding his eminent ability, he does not seem to have exercised much influence on the thought of his own time or of the succeeding period. His project of a Roman Catholic revival, and his retrograde attitude in politics, doubtless created a prejudice against his general philosophical views; but it ought always to be remembered that his doctrines, though favouring the reaction, were not dictated by self-interest; throughout his career he advocated principles essentially identical, and, in supporting Metternich's policy, he believed himself to be serving the highest interests of Germany and of Europe. Some of his higher tendencies, freed from much of their alloy, are reproduced in the writings of the historical school of German economists (comp. GERMAN SCHOOL).

Among the publications of Müller less important than the *Elemente der Staatskunst*, the following may be enumerated: *Die Theorie der Staatshaushaltung und ihre Fortschritte in Deutschland und England seit Adam Smith*, 1812.—*Versuch einer neuen Theorie des Geldes*, 1816.—*Vermischte Schriften über Staat Philosophie und Kunst*, (2 vols., 2nd ed., Vienna, 1817)—and *Von der Nothwendigkeit einer theologischen Grundlage der gesammten Staatswissenschaften und der Staatswirthschaft insbesondere*, 1819.

[Mischler in *Allg. Deutsche Biogr.*—Lippert in *Handw. der Staatswissenschaften.*—Roscher, *Gesch. der N.O.*, p. 763.—Kautz, *Die Gesch. Entwickelung der Nat.-O.*, p. 659.—Cossa, *Introd. allo Studio dell' E.P.*, p. 320.—Cohn, *Nat. Ock.*, i. p. 12.]

J. K. I.

MULTIPLICATION OF SERVICES is a term employed by JEVONS (*Scientific Primer*) to denote that one of the advantages attending *Division of Labour* which arises when "nearly the same time and labour are required to perform the same operation on a larger or on a smaller scale"—in the words of WHATELY, who seems first to have pointed out this advantage (*Lectures on Political Economy*, vi.). Thus, "if a messenger is going to carry a letter to the post-office, he can as readily carry a score" (Jevons, *loc. cit.*). This advantage is connected with production on a large scale, under which head it is treated by MILL (*Pol. Econ.*, bk. i. ch. 9).

"Multiplication of copies" (Jevons, *loc. cit.*) is a particular but important case. When once type has been set up, additional copies can be printed without much additional expense. A similar advantage is afforded by the use of "interchangeable parts" (Marshall) in machinery.

F. Y. E.

MUN, THOMAS (1571-1641), the best-known writer on the mercantile system, was son of John Mun, mercer, of London. As a member of the committee of the East India Company, and of the standing commission on trade (appointed in 1622, reappointed in 1625) "he was in his time famous amongst merchants and well known to most men of business, for his general experience in affairs, and notable insight into trade" (*England's Treasure by Foreign Trade*, John Mun's epistle dedicatory to Thomas, Earl of Southampton). In 1621 he published, in defence of the East India Company, *A Discourse of Trade from England into the East Indies*, reprinted in the same year, in Purchas's *Pilgrims* (1625), and in *Early English Tracts on Commerce*, London, 8vo, 1856. He is, however, best known by his posthumous work, *England's Treasure by Foreign Trade, or The Balance of our Foreign Trade is the Rule of our Treasure*, London, 8vo, 1664, republished in 1669, 1698, 1700 (in Lewis Roberts' *Mappe of Commerce*), 1713, 1755, 1856 (*Early Tracts on Commerce*), and 1895 (*Economic Classics*, edited by W. J. Ashley). There are two well-known allusions to this work in Adam SMITH'S *Wealth of Nations*, bk. iv. ch. i., in the first of which Smith quotes the concluding paragraph of the fourth chapter: "If we only behold the actions of the husbandman in the seed-time," etc.; and in the second, states that "the title of Mun's book . . . became a fundamental maxim in the political economy, not of England only, but of all other commercial countries."

The importance of Mun's work in the development of economic theory in England has been pointed out (ENGLISH EARLY ECON. HIST., vol. i. pp. 722 *seq.*, 730). The date of its composition and its publication are of considerable interest. It was published twenty-three years after Mun's death, by his son John, who states in the epistle dedicatory that it was left to him "in the nature of a legacy" by his father. But it appears to consist of several short papers, some of which were written about 1622, and all before 1628. Whether the final form and arrangement of the treatise is due to Mun himself or his son John, there is nothing to show. Ch. i., on "the qualities which are required in a perfect merchant of foreign trade," probably formed part of the "former discourse," to which he alludes in his address to his son, in which he proposed to teach him "how to love and serve his country, by instructing him in the duties and proceedings of sundry vocations." The opening sentence, the

marked difference of style between this chapter and the rest of the treatise, and other circumstances, point to this conclusion. In ch. ii., on "the means to enrich the kingdom," etc., and ch. iii. on "the particular ways and means to increase the exportation of our commodities," etc., he follows the order indicated in the address to his son. The following chapters are taken up with (1) the discussion of the advantages of the exportation of bullion; (2) replies to various arguments employed by MALYNES and MISSELDEN, in their controversy of 1622-23, and to the advocates of the debasement of the currency; (3) the fuller discussion of points briefly touched upon in ch. iii.; and (4) the method of calculating the balance of trade. Chs. iv. to vii. correspond almost verbatim to the *Petition and Remonstrance of the Governor and Company of Merchants of London trading to the East Indies*, which was drafted by Mun, and presented to the House of Commons in October 1628. This portion of *England's Treasure* may have been the rough draft of the *petition*. The differences between the two at any rate point to the fact that the latter was based upon the former. Chs. viii. to xv. are entirely taken up with the discussion of various arguments urged by Misselden and Malynes, and the advocates of the debasement of the currency. He objects to Misselden's contention that the want of money was due to the undervaluation of silver (*Free Trade, or The Means to make Trade flourish*, 1622), no less than Malynes's theory of the foreign exchanges (*The Maintenance of Free Trade*, 1622; *Lex Mercatoria*, 1622, etc.). He devotes the whole of ch. xiv. to a discussion of the "admirable facts" attributed to the bankers by Malynes, whom he accuses of "disguising his own knowledge with sophistry to further some private ends by hurting the public good," *i.e.* by re-establishing the office of royal exchanger. In his first pamphlet, Misselden had been anything but friendly to Mun's views on the East India Company; but his second pamphlet, *The Circle of Commerce*, etc., 1623, gives unmistakable evidence of Mun's influence. Ch. xv. of *England's Treasure* appears to be mainly a reply to Malynes's *Canker of England's Commonwealth*. Chs. xvi.-xviii., "on Revenue, etc.," must have been written not later than the early years of the reign of Charles I.; while ch. xix., in which Mun discusses the fishing trade, and quotes from the Dutch proclamation of 19th July 1624, was put into shape not very long subsequent to that date. The last two chapters deal with "the order and means whereby we may draw up the balance of our foreign trade," and "the conclusion upon all that hath been said concerning the exportation or importation of treasure." There appears to be no allusion throughout the treatise to any event later than 1624. No part of the work can have been written later than 1628, when the Petition and Remonstrance was presented to parliament, and most of it belongs probably to the years 1622-1625. The inquiry after the restoration into the desirability of legalising the exportation of bullion, followed by the act of 1663 (15 Car. II. c. 7), probably suggested the publication of Mun's work.

[A full account of Mun's life is given in the *Dictionary of National Biography*. For other points in his work see ENGLISH EARLY ECONOMIC HISTORY and ENGLISH SCHOOL OF POLITICAL ECONOMY, vol. i. pp. 719-737 (EXCHANGER ROYAL), and the authorities quoted there. See MERCANTILE SYSTEM.] W. A. S. H.

MUNICIPALITY.

Roman, p. 829; Mediæval, p. 830; Modern, p. 831; Municipal Government in Belgium, p. 831; in France, p. 832; in Italy, p. 834; in Prussia, p. 834; in United States of America, p. 837.

THE term municipality is ambiguous. Sometimes it signifies a town which is treated as a distinct unit for purposes of administration and sometimes the administrative authority in such a town. In another article (see ADMINISTRATION), it has been shown that in a large community it is impossible to concentrate the whole business of executive government at one spot, and that the centres of administration must be multiplied. It has also been shown that most governments have not merely spread their official administrators over the whole territory, but have enlisted private citizens in such portions of administrative work as immediately affect a particular neighbourhood. A certain degree of decentralisation and of local self-government is necessary to the proper administration of a great civilised state. Towns and cities have naturally obtained the largest share of these privileges, and for a long time throughout the greater part of Europe local self-government meant municipal self-government.

Roman Municipalities.—The earliest available instance of municipal self-government on a grand scale is afforded by the Roman power. Whilst the Romans established a universal empire, they never quite abandoned the antique idea that the city is the normal political community. Under the Roman emperors the Mediterranean world was divided into thousands of urban communities. Each city possessed a more or less extensive territory, and within this territory certain powers of self-government were exercised by those who possessed the franchise of that city. As the whole empire, or at least all its civilised portions, were thus divided into urban districts, no antithesis arose between urban and rural authorities. It was as though every English county were administered by those who possessed burgess rights in the county town, but it must

be added that residence was not in antiquity a necessary condition of obtaining such rights. The Roman municipal system was unquestionably a boon to the countries in which it was established; it served to keep alive the local patriotism, the interest in public business, and the spirit of public munificence so apt to dwindle among the subjects of a despotic monarchy. Magnificent remains scattered over most of the countries of the Mediterranean still show how nobly the municipal authorities of the Roman towns provided for the health, the convenience, the education, and the amusement of the burgesses. It is true that municipal extravagance and mismanagement were also common. Those defects afforded an excuse for the interference of the central government, and by degrees the Roman municipalities became practically powerless. Finally the barbarian conquests wrought such havoc in the Roman municipal system that it is doubtful how far any connection can be traced between it and the municipal system of the middle ages which next claims attention.

Mediæval Municipalities.—When the era of barbarian inroads finally closed in the tenth century, and the revival of civilisation brought prosperity again to towns, a new period of municipal development began. In this period municipal life is strongly contrasted with rural life. Feudalism laid its closest grasp on the rural districts, where a hierarchy of petty princes reigned one above another, and the lowest class of the population were in an almost servile condition. Important towns generally succeeded in placing themselves under the immediate protection of the sovereign or of a feudal magnate of the highest class, and all the inhabitants of such towns were personally free. Thus in the towns there was a scope for ambition and a security for hoarded wealth unknown in the country districts. In this period also municipal self-government frequently grew into something like political independence. None of the municipal towns of the Roman empire could have hoped to resist the will of the Roman emperor. But the municipalities of the middle ages had only to deal with feudal monarchs, whose real power was often as little as their titles were pompous. In the mediæval system of warfare, the means of attack were so much inferior to the means of defence that it was extremely difficult to reduce a large walled city, defended by a numerous and enthusiastic people. The burgess militia, however inferior to regular troops, were often more than a match for the arrogant and undisciplined knighthood. The most superficial readers of mediæval history know how the burghers of Milan stood a siege by the Emperor Frederick Barbarossa, and how the burghers of Ghent more than once faced the chivalry of France in the open field. Thus the great municipal towns of Italy became practically sovereign states, and the great municipal towns of Germany and Flanders became hardly less than sovereign. Lastly, the municipal organisation of mediæval towns was to a large extent industrial. There is no room here to discuss the history of the merchant and craft gilds or their relation to the government of the towns in which they arose. Nor is it safe to lay down any general law of development with reference to the constitutions of mediæval municipalities. In a majority of cases, perhaps, the result was the absorption of power by an urban aristocracy of commerce and industry, as opposed to the feudal aristocracy of land-owners in the country districts. Under these circumstances it was natural that mediæval burghers should be prone to fierce internal dissensions, and to an exclusive local patriotism, not merely hating the feudal lords and contemning the peasantry, but intensely jealous of the power and prosperity of any town but their own, a fatal weakness which was fully exemplified in the history of Flanders, and of Italy. At the same time the services rendered to civilisation by the mediæval municipalities were incalculable. At a time when the bulk of the country population in central and western Europe were little better than beasts of burthen, the municipal towns were sanctuaries of industry, art, and learning. Their wealth was such as under the conditions of the time might seem incredible, were it not yet attested by the splendour of their churches, of their municipal buildings, and even of their private mansions. But the condition of their freedom and power was the continuance of semi-barbarism without the walls. When feudal anarchy had been suppressed in the country districts, monarchs no longer needed the support of privileged towns. When the invention of gunpowder had transformed the art of war, town walls were no longer impregnable, and the burgher militia became useless against professional soldiers. The exclusive jealous spirit which set town against town, and class against class, made impossible all resistance to a centralised despotism. From the close of the 15th century onwards, the central government everywhere gained rapidly upon municipal independence.

In England the history of municipal development was somewhat different. Self-government by the free inhabitants prevailed there in rural as well as in urban neighbourhoods, and the representatives of the towns took part in the county courts. Again the towns were relatively far less important in England than in Italy, Germany, or even France, for mediæval England was an agricultural and pastoral, rather than an industrial or commercial country. Thirdly England attained national unity and a powerful government at a comparatively early time. Lastly, the old free institutions were never overthrown

in England as elsewhere. Owing to all these causes municipal towns in England never occupied so distinct or so conspicuous a place, whilst they escaped such a complete enslavement as befell municipal towns on the continent of Europe.

Modern Municipalities.—The third period of municipal development, which may be termed the modern period, may be dated from the French revolution. That revolution, and the revolutions which followed it, have converted the despotic monarchies of central and western Europe into governments more or less popular. The same desire for self-government which prompted this change led to a demand for reformed municipal constitutions. In England reform came more naturally as the feeling of local independence and the interest in local affairs had never quite died out. In the United States vigorous municipal institutions existed even prior to the separation from the mother country. This new municipal life differs from the municipal life of the middle ages in several weighty respects. The long-continued pressure of the central government, and the changes wrought by modern civilisation, have lessened the contrast between town and country. Municipal self-government has been very generally extended with some modifications to the rural districts of this and of other countries. Again, the modern municipal town cannot aspire to political independence. Military power is now centred in the hands of the national government to an extent never paralleled save under the Roman emperors. Lastly, the exclusive spirit which formerly parted town from town, and the ruling class of each town from the rest of the citizens, has practically disappeared. Modern municipal self-government is democratic, and the only dangers which threaten its future are those incidental to democracy, such as the withdrawal of sensitive and high-minded men from public life, the too ready reception accorded to demagogues, and the popular fallacy that too much money cannot be raised in rates or spent in wages. Several cities of the United States have afforded the most alarming examples of robbery and corruption. It is not reassuring to learn that a common remedy for these evils is to appoint some eminent citizen as a dictator, for this is an acknowledgment that municipal institutions have no power of self-purification. In Germany it is a not infrequent practice for the municipality to entrust the administration to a professional expert. In France, and especially in Paris, municipal profusion is conspicuous. Similar tendencies have developed in England. What functions should be entrusted to a municipal body is a large and complex question which cannot be solved without wide experience Watching, lighting, sanitary control, and the execution of public improvements, are clearly within its province. Much may be said in favour of entrusting to it the provision of such articles of general use and necessity as are already subjects of a virtual monopoly, *e.g.* the supply of gas and water. But there is nothing to justify the belief that the municipality should be sole landlord or sole capitalist in the town. There is no reason to suppose that a town council is fit to manufacture cotton goods or ship plates. The supply of men fit for municipal office is small; the time which they can give to public affairs is limited; and under the conditions of modern life much alteration in either respect is not likely to be made. The tendency to ask of municipal bodies more than they can possibly perform is the most serious danger which threatens municipal self-government in modern Europe.

MUNICIPAL GOVERNMENT IN ENGLAND. See CORPORATION, MUNICIPAL; METROPOLIS; MUNICIPALITY.

MUNICIPAL GOVERNMENT IN BELGIUM. The words *municipalité*, *municipal* are not used by the Belgian constitution or laws on the subject; the words *commune*, *communal* have alone a legal standing.

Under the Dutch rule of the beginning of last century, a distinction was maintained between the administration of the towns and what was called the "flat country" (*le plat pays*); the communal law of the 30th March 1836 submitted the whole of the territory to a uniform communal legislation.

According to the constitution, the communal councils must be directly elected by the electoral body; their power extends over all subjects of communal interests, the central government having only the right to declare void any resolution in contradiction with the general interest, and their sessions and accounts must be kept open to publicity. These general principles laid down in the constitution of 1831, have been further developed by the already-mentioned law of 1836 which is still in force, except, as we shall presently see, for the mode of election of the councillors.

The number of councillors varies from seven to thirty-one according to the figure of the population; no restriction is laid on their meetings; they meet whenever it is expedient for the transaction of communal business, the *bourgmestre* (mayor) occupying by right the

chair. Their right to impose local taxes to supply the financial wants of the *commune* is far more extended than in France and in Italy, and in fact, almost unlimited.

The *bourgmestre*, who is at once the agent of the king and the head of the *commune*, is nominated by the king, who possesses the right of selecting him even outside the communal council, a royal prerogative which remains practically dormant. With the *échevins* (aldermen, from the Flemish *schepen*, in mediæval Latin *scabini*) formerly nominated by the king, now elected by the council, the *bourgmestre* forms the *collège échevinal*, or executive committee entrusted with the daily local administration, but in matters of *état civil* (public registration of births, marriages, and deaths) and of police, the *bourgmestre* has a distinct and individual authority of his own and is personally responsible for public order.

The king cannot dissolve a communal council, though he may cancel any resolution, illegal or opposed to the general good. The *députation permanente* of the provincial council is also entrusted with some powers of control on certain specified subjects, but, on the whole, Belgium is one of the countries on the continent where local autonomy and independence is most extended, and most solidly founded on an almost uninterrupted transmission of traditions and customs tracing their origin to the flourishing period of Ghent, Bruges, Ypres, etc., during the last centuries of the middle ages.

A quite recent law (May 1895) has considerably enlarged the communal electoral body. Every Belgian citizen aged thirty and having three years' residence is now entitled to one vote. He may acquire from one to three extra votes, if he is married, in possession of certain degrees or diplomas, directly taxed for a certain *minimum* amount, or in receipt of a certain income.

[For the middle ages see Professor Van der Kindere, *Le Siècle des Artevelde*, Brussels, 1879, Alphonse Wauters, *Les Libertés Communales, Essai sur leur Origine et leurs premiers développements*, Brussels, 1878, and Pirenne, *Histoire de la Constitution de Dinant* and *Histoire de Belgique*, 2 vols. (published 1900 and 1903). Several collections (*Recueils des Ordonnances, des anciennes coutumes de la Belgique, coutumes de Flandre, du Brabant*, etc.) have since 1850 been published by official authority.

MUNICIPAL GOVERNMENT IN FRANCE. The *commune* is the ultimate territorial and administrative unit of France; this name is now equally applied to the towns and the rural parishes (*paroisses*) which used to be kept distinct before the French Revolution. At the time of the latter, the *Assemblée Constituante* recognised the legal existence of about 44,000 *communes* for continental France; the present number slightly exceeds 36,000, about one-half of which have a population inferior to 500 inhabitants. It is generally considered that a further reduction of this number by means of the consolidation of neighbouring diminutive rural *communes* would be desirable.

Excepting Paris and, to some extent, Lyons, all French *communes* are regulated by the law of the 5th of April 1884 on municipal organisation, which has repealed or modified the former legislation of 1837 and 1855; according to the preliminary report presented to the chamber of deputies, it was intended to be "a reform most favourable to the extension of communal freedom." The following summary will show that space still remains for further extension, and that, with the exception of their everyday business, French municipal authorities are only allowed to move under the *tutela* of the central government and its official delegates, the *préfet* and the *sous-préfet*.

"The municipal body of each *commune* is composed of the municipal council, the *maire* and one or several *adjoints* (or deputies of the *maire*)." Such is the text of article 1 of the law. The minimum number of municipal councillors is 10 for *communes* under 500 inhabitants, and progressively rises with the population to a maximum of 54. The *maire* and *adjoints* are elected from their own body by the municipal councillors, themselves directly elected by all male inhabitants above twenty-one, settled in the *commune* or resident there six months and not in actual receipt of relief from the *Bureau de Bienfaisance*. Non-resident voters are admitted on their demand, if their names are on the list of taxpayers, but nobody is allowed to vote in more than one *commune*. All male inhabitants, paupers of course excluded, or taxpayers above twenty-five years of age are qualified to be elected, but the number of non-resident councillors must not exceed one-fourth of the total number of councillors. Several classes of state or municipal officials, such as the public schoolmaster and priests, cannot be elected.

Municipal councils are elected for four years; they may, in case of urgency, be suspended for one month by the *préfet* of the department, but the President of the Republic is alone empowered to dissolve them and his decree must

state the motives of the dissolution. He then appoints a provisional delegation of 3 to 7 members entrusted with the management of urgent affairs; a new election must take place within two months.

The *maire* and municipal councillors can draw no salary, but the reimbursement of actual expenses is permissive, and the *maires* of large towns sometimes are awarded what are called *frais de représentation*—expenses for receptions and entertainments, etc.

Municipal councils have four annual ordinary sessions, three of a fortnight and one for the debates on the budget which may last six weeks. The *préfet* and *sous-préfet* may summon them for an extraordinary convocation, so also may the *maire* who is further obliged to summon the council whenever required to do so by a majority, specifying the object of its request. In this case he must inform the *préfet*, and only the specified questions can be discussed.

The *maire* is legally the chairman, except when his own administrative accounts are examined. As a rule, the meetings of the council are open to the public, and an extract from the journals must be stuck up at the door of the town hall within the week. Every inhabitant or taxpayer is entitled to claim the perusal of the journals, municipal budget, and accounts, etc.

The specific functions of the council as enumerated by article 61 of the law are—

(*a*) to regulate by its resolutions the business of the *commune*.

(*b*) to give its advice when required by law or by the superior authorities.

(*c*) to protest if necessary against the *quota* of apportioned taxes assessed on the *commune*.

(*d*) to express wishes (*vœux*) on all subjects of local interest.

(*e*) to draw up the list from which the prefectoral authority nominates the assessors for the apportionment of certain taxes. An extract of all resolutions is to be sent within a week to the *sous-préfet* by the *maire;* if these exceed the range of the legal attributions of the council they are legally void and are declared so by the *préfet*. Political wishes fall under this description; still the delegates of all the municipal councils make up the bulk of the electoral body for the French Senate. Every taxpayer and any person having an interest at stake, is also entitled to sue for a declaration of nullity of a resolution within a fortnight. The council of state is the supreme jurisdiction for all suits of this kind.

French *communes* are legally capable to own property, both movable and real, constituting either their public domains, *e.g.* schools, hospitals, streets, libraries, churchyards, etc. or their private domains, *e.g.* houses, arable land, fields, woods, consolidated state funds. Houses and land may be sold, rented, and farmed, but the terms of these transactions must be approved by the superior authorities, even for leases, when they exceed eighteen years. The same approval is necessary for all resolutions on rights of commons, on acceptance of legacies and donations, if hampered with charges or conditions, or giving rise to opposition from the family of the testator or donor; for the communal budget, the vote of supplementary supplies; the raising of extraordinary taxes or contracting of loans, if their principal exceeds a certain proportion. The foundation or suppression of fairs must also be sanctioned by the *préfet*. Even resolutions, which do not require his sanction, only become executory one month after they have been notified to him.

The council is not allowed to publish proclamations or to enter into correspondence with other municipal councils, unless in a few specified cases and always under the prefectoral supervision. No *commune* can appear in court without being authorised by the *préfecture*.

The budget of each *commune* is proposed by the *maire*, voted by the municipal council, and sanctioned by the *préfet*; whenever the communal income exceeds 3,000,000 of francs (£120,000), the final approbation of the President of the Republic is requisite. Certain items of expenditure are compulsory; let us mention as such the registration of births, marriages, and deaths; the repairs of communal buildings and public churches—for the latter in case of insufficiency of the means at the disposal of the *conseil de fabrique* (vestry)—the communal share in the expenses concerning public instruction; the keeping in order of cemeteries and communal roads; the salaries of specified communal functionaries, etc. The *commune* must also provide for the expenses of its police, notwithstanding the fact that in towns of more than 40,000 inhabitants, the personal regulation of the force belongs to the President of the Republic. Thus, although the *maire* is nominally the head of the municipal police, his immediate subordinates, the *commissaires* of police, are in fact the agents of the prefectoral administration. It must not be forgotten that the *maire* himself is at the same time the elected representative of the *commune* and the local agent of the central government; until the end of the second empire, he was appointed by government, which has kept the right to dismiss him.

In one respect the communal councils are subject to the permanent control of local taxpayers. Article 123 of the law empowers any one of these to initiate at his own risk, and with the agreement of the *conseil de préfecture*, "the lawsuits which he considers to belong to the *commune*, and which the council having been invited to discuss has refused or neglected to prosecute." The resulting judicial decision binds the *commune*.

From this slight sketch it will appear that,

compared with other countries, the French municipal authorities are confined within rather narrow official trammels. French political parties clamour for decentralisation only as long as they remain in opposition.

[See *les Controverses sur la Décentralisation administrative* in the *Revue Politique et Parlementaire* (April and May 1895), by Léon Aucoc, the highest authority on the subject.

French urban municipalities and *communes* have a double origin; in southern France they were generally survivals or revivals of Roman Municipia; in the north they arose during the 12th century from the revolts of the *bourgeoisie* against their feudal lords. For this movement see Augustin Thierry, *Lettres sur l'Histoire de France* and *Essai sur la Formation et les Progrès du Tiers État.*—Luchaire, *Les Communes française à l'Epoque des Capétiens directs* (1890).—Guizot, *Cours de l'Histoire de la Civilisation en France*, and numerous monographs such as Flammermont, *Les Institutions Municipales de Senlis* (1881).—Prou, *Coutumes de Lorris aux XII^e et XIII^e Siècles* (1884).—Giry, *Établissements de Rouen* (1883).—Bonvalot, *Le Tiers État d'après la Charte de Beaumont* (1884), etc. The French kings favoured the *communes* in their struggles against their *Seigneurs* (see Giry, *Documents pour les relations de la Royauté avec les Villes au XII^e et au XIII^e Siècles*, 1885). Two centuries later the towns had to submit to the royal power. For the period extending hence to modern times, see de la Poix de Fréminville, *Traité Général du Gouvernement des communautés des villes, bourgs, villages et paroisses* (1760).—Boileau, *Recueil de Règlements concernant la Municipalité* (1785).—Raynouard, *Histoire du Droit Municipal en France* (1829), and Béchard, *Histoire du Droit Municipal au Moyen Age et dans les Temps Modernes* (1875).

For the present times, see Pascaud, *De l'Organisation Municipale et Communale en Europe, aux États Unis et en France* (1877).—H. de Ferron, *Institutions municipales et provinciales comparées* (1884), and the great work (in 8 vols.) of A. Batbie, *Traité théorique et pratique du Droit Public et Administratif* (1885).—Yves Guyot, "Municipality of Paris," *Contemporary Review*, 1883.]

E. Ca.

MUNICIPAL GOVERNMENT IN ITALY. The law of the 20th March 1865 is still in all essential points the great charter of Italian municipal organisation. On four of these points it is modelled on the Belgian legislation: thus the *sindaco* (or mayor) is nominated by the king who can also remove him; the qualification of a voter is based on the annual payment of one or another direct tax with a *minimum* varying from 5 to 25 lire (say 4s. to £1) according to the population; moreover, owners of university degrees, civil and military officials, professors, bearers of an Italian order, etc. are electors by right, and unlettered citizens cannot vote; in financial matters and questions of communal property, the control over the resolutions of the communal council rather belongs to the *deputazione provinciale* (permanent delegation of the provincial council) than to the prefect; and, fourthly, the *giunta municipale* comprising the *sindaco* and from two to ten *assessori*—the latter elected by the members of the *consiglio comunale* among their own members—have corporate existence recognised by law, like the Belgian *collège échevinal.* In other points the example of France was followed. Thus communal councils have two ordinary annual sittings, not exceeding thirty days each, unless a prolongation be granted by the provincial deputation; for extraordinary sessions they must be summoned by the prefect, acting either *ex officio*, or on the petition of the *giunta*, or of one-third of the councillors, and in these extraordinary sessions resolutions can only be taken on questions specified beforehand. In the interval between the sittings, the *giunta* represents the communal council, to which it is accountable. In all deliberations concerning the budget, the prefect has always the right to be heard. He, as well as the communal councils themselves, may appeal to the king against any decision taken by the provincial deputation in its controlling capacity.

[Several papers on Italian Municipal Administration have appeared in the *Bulletin de la Société de Législation Comparée*, 1877, pp. 97-126; 1881, pp. 266-307 and 325-344; 1882, pp. 413-430.]

E. Ca.

MUNICIPAL GOVERNMENT IN PRUSSIA. The year 1808 marks the beginning of a new era in the history of the Prussian administrative system, and especially in the form of municipal government. The social and political condition of the country immediately after the Thirty Years' War demanded radical changes, if it was to maintain its individuality amongst the civilised nations. The cities, after having attained, during the second half of the middle ages, a large measure of local independence and general prosperity, gradually lapsed into a condition of state tutelage. The 17th and 18th centuries found them stripped of every vestige of municipal authority and self-government. They had become *close corporations*, whose officials were appointed through, and dependent upon, state patronage. The complete disruption of the country through the crushing defeats inflicted by Napoleon in 1806 and 1807 made this organic weakness so apparent to the leading statesmen of the time that positive steps towards reform were immediately taken. The group of laws known as the *Stein-Hardenbergsche Gesetzgebung* forms the first and most important chapter in the series of administrative reforms of which the legislation of 1872 and 1876 marks the closing step.

To Stein is due the Municipal Corporations Act of November 19th, 1808, which is still the basis of municipal government in Prussia. In the acts of 1831, 1850, and 1853, which latter is at present in force, modifications in a con-

servative spirit were introduced tending towards a somewhat stricter control of municipal action by the central government.[1]

The general characteristics of municipal government in Prussia find such distinct expression in the organisation of the administration of Berlin that the description of the latter gives an adequate idea of the general system.

The general city administration of Berlin is in the hands of an Executive Board or *Magistrat;* a Municipal Council; and a series of *Deputations* or committees, the nature of which we shall have occasion to examine.

The *Executive Board* (*Magistrat*).[2]—This board occupies a twofold position. It is entrusted with the execution of purely city affairs, and is also the representative of the state for the exercise of the more general or state functions. In the former of these capacities it is responsible to the municipal council, in the latter to the central government.[3] It is composed of a chief-mayor, vice-mayor, and thirty-two aldermen. Of these thirty-four offices, seventeen are professional in character, and therefore paid; the remaining seventeen unsalaried or honorary, to which every citizen is eligible. Acceptance of the unsalaried offices is obligatory. All members of the executive board are elected by the city council, the salaried members for a period of twelve, the unsalaried for six years. All are re-eligible, and the salaried offices are practically life positions.

The mayor is the presiding officer of this board, and has the legal right to veto its decisions.[4] Where the board and the mayor are in actual conflict the ultimate decision is placed in the hands of the supreme administrative court (*Oberverwaltungsgericht*). It is necessary to examine briefly the method of settling these disputes, as this illustrates one of the leading features of the Prussian administration. The question of the jurisdiction of the administrative courts and the semi-judicial bodies, which has acquired such importance since the reforms of 1872, 1876, and 1883, is exceedingly complicated. They are intended to settle such administrative disputes as may arise between the citizen and the public administration and between the various organs of the local or general administration. In cases where such differences have arisen between the executive board and the municipal council, the general rule is an appeal to the district committee[1] as administrative court of the first instance, and to the supreme administrative court for final decision. Berlin offers an exception to this general rule, for in cases of such differences the supreme administrative court acts as first and final resort.

The vice-mayor acts as substitute to the mayor in the details of his administrative duties. The remaining fifteen salaried members of the executive board are as follows:—two corporation counsel, two school councillors, two city architects, a city treasurer, and eight additional members. It is characteristic of the Prussian system that the incumbents for these salaried offices are chosen from all parts of the kingdom. The office of mayor in the larger towns is a purely professional one. Men who have gained a reputation as efficient administrators in the smaller cities are called to fill the important offices in more important centres. The choice of the city council for both salaried and non-salaried members of the executive board requires the approval of the provincial government. This apparently far-reaching restriction on local self-government is, as a general rule, a mere matter of form. It is to this executive board that the great bulk of the general city administration falls. In addition to its executive functions it may be regarded as constituting a part, at least, of the legislative branch of the city government, inasmuch as all decisions of the municipal council require the approval of the executive board. That this combination of executive and legislative powers makes the executive board by far the most important of the organs of the city administration is evident. In cases where the city council and the executive board come into conflict the supreme administrative court decides, upon the appeal of either body.

The detailed control and general administrative supervision of the various municipal departments is exercised by the committees, or *deputations* already mentioned. We have here one of the peculiar characteristics of the

1 It is important to note that the Prussian system makes very clear distinction between urban and rural communities, and that the laws applying to each are entirely different. In this respect it differs entirely from the French system of local government, where no such distinction is made, the same form of local government applying there to both urban and rural communities.

2 The salaries of the most important offices in the city government are as follows:

In the executive board the minimum compensation of paid members is 7000 marks. These salaries are increased from year to year in proportion to the term of service.

The highest salary of a regular member of the executive board is at present 11,600 marks.

The mayor receives 30,000 marks.

The vice-mayor 18,000 marks.

The salaries of chiefs of departments range from 3000 to 6000 marks. A few, such as the superintendent of the city insane asylum, receive as much as 9000 marks.

Members of the town council receive no compensation.

3 It is to be noted that the government of Berlin is representative of the municipal system in the seven eastern provinces of Prussia. In the western provinces a system more closely resembling the system of the French *communes* is to be found.

4 Very few instances of the exercise of the right have occurred, so that it is almost looked upon as non-existent. It has nevertheless given the mayor a very strong influence, moral if not legal, in determining the policy of the board.

1 This committee is composed of the district president, two members appointed by the king, and four citizens elected by the provincial committee. Although Berlin has such a committee, it does not exercise the same extensive functions as in other parts of the kingdom; its constitution is also somewhat different.

Berlin administrative system. It is an attempt to bring about a personal union between the executive and legislative branches of the city government and the general body of citizens. These committees are made up of city councilmen and private citizens, elected by the city council, to whom the executive board adds a number of its members. One of the latter acts as presiding officer. The exact proportion of representation from the various bodies is determined by municipal ordinance. There are at present the following *deputations*:—on taxation and military affairs, poor-law administration, streets and public buildings, street cleaning, schools, city property, parks, pensions, fuel, stationery, public health, statistics, street lighting, water-works, savings-banks, gymnastics, and industrial schools. The heads of the various municipal departments are, for the most part, experts entrusted with the executive policy of their particular department, and are responsible to these deputations for their financial and administrative methods.

The Municipal Council.—The leading feature of the Prussian Municipal Corporations Act is the absence of any minute and detailed grant of power, either to the city as a whole or to the municipal council in particular. On the one hand, its competency is limited by the general sphere of municipal action, and, on the other by the powers expressly and exclusively vested in the executive board. Not only is it charged—in connection, as a rule, with the executive board—with the financial and general administrative legislation, but it also exercises a strong control over the purely executive acts of the city administration. This is done through a series of standing committees entrusted with the examination of the accounts, contracts, and other acts of the various departments. It is, however, important to note that the executive branch is not compelled to carry out the will of the city council, unless this meets with its approval. In order that this conflict may be avoided as far as possible, the executive board has the right, and, upon the demand of the city council, may be required, to send representatives to the meetings of the council. The city council is elected by the tax-payers through what is known as the *three-class* system, adopted in 1849 for state elections, and soon after incorporated in the Municipal Corporations Act. The tax-payers are, for purposes of electing members of the municipal council, grouped into three classes, according to the amount of direct taxes paid by each. The first class comprises those among the most heavily-taxed inhabitants whose total contribution is one-third of the aggregate. They elect one-third of the city councillors. The next group, paying an equal amount, *i.e.* another third of the total sum, elect the same number. The remaining qualified voters elect the final third of the total number of city councillors. It is evident that, according to this system, the wealth of the community really determines the character of the municipal council. Thus in 1887, with 3849 voters of the first class, 17,730 of the second, and 192,274 of the third, a comparatively small percentage of the population of Berlin exercised the controlling voice in the election of its council.

To the general rule of local self-government in the various municipal departments, there is one important exception, which is, however, not peculiar to Berlin, but characteristic of all the large Prussian cities. In all the smaller communities, the mayor is entrusted with the police administration. In cities the population of which exceeds 10,000, the minister of the interior has the power to place an official appointed by and responsible to him at the head of the police service. He is known as the president of police (*polizei-präsident*). He has charge of the department of public safety in the narrower sense of the term. The other branches of the police service, *i.e.* such as are not immediately concerned with the preservation of peace and order, like the health, trade, and building police, remain a part of the city administration proper.

The cost of the police service is paid out of the state treasury, but the city is required to contribute 2½ marks per capita of population. This represents hardly one-third the entire cost.[1]

To sum up the general characteristics of the Prussian system, we find in the first place a strong tendency towards decentralisation, in order directly to interest a large body of citizens in the work of public administration. In the various deputations, poor-law commissioners, ward provosts, and the like, nearly 10,000 of Berlin's citizens are devoting some of their best energies to the city's welfare.

The city council, while possessing important legislative functions, exercises an important control over the acts of the executive board. The position of the latter both as executive branch of the city government and upper chamber of the legislative branch, gives it the preponderating influence in determining the general policy of the city administration. The unique position occupied by the *deputations* is another of the distinguishing features of the Prussian municipal system. And finally, the fact that at the head of the several municipal departments, and determining their executive policy, we find a series of experts who are devoting their undivided attention to the gradual development of their particular departments, is of the utmost importance in explaining the admirable methods pursued on the more technical sides of municipal action.

[1] Although Berlin pays 2½ marks per capita, the smaller cities pay a much smaller sum. The per capita contribution is graded according to population.

Through this happy combination of individual responsibility and popular control, the administration of Berlin has reached a degree of efficiency to which perhaps no other of the great cities of the world can offer a parallel.

S. R.

MUNICIPAL GOVERNMENT IN UNITED STATES OF AMERICA (PENNSYLVANIA, PHILADELPHIA). In considering the question of municipal government in the United States, it is necessary to bear in mind the distinction between the American and the continental concept of the municipality. In the former the municipality is the creature of the legislature, with clearly and minutely defined powers, which form the absolute limits to its action. No general sphere of municipal action, within the limits of which it may exercise its own discretion without the menace of interference on the part of the state legislature, is recognised. On the European continent we find a much broader view prevailing. The law distinctly recognises a field of municipal action, with which the central government can in no wise, or at least only in extreme cases, interfere. The continual interference of the state legislature in municipal affairs has been one of the characteristic features of municipal development in the United States. The large cities have been the greatest sufferers in this respect, and their history and present condition cannot be understood without a distinct recognition of this fact.

The municipal system of the state of Pennsylvania recognises two kinds of municipal corporations;—boroughs and cities. The former is, in general, an incorporated township or portion of a township or townships, with less than 10,000 inhabitants. The cities are for purposes of government divided into three distinct classes.[1] The effect of this division upon the question of state interference in municipal affairs we shall have occasion to examine when treating of the municipal provisions in the state constitution. The three classes above mentioned are as follows:

1. Those containing a population of 600,000 or over.
2. Those with less than 600,000 but exceeding 100,000.
3. Those with less than 100,000.

[1] Act, 8th May 1889, Pa. Laws, p. 133, 1. Act held to be constitutional, see Wheeler *v.* Phila. 77, Pa. 347.

While the differences in the form of government of these various classes of cities are important, the existing organisation of the city of Philadelphia is sufficiently typical to give a general idea of municipal organisation in Pennsylvania. The main differences relate to the number, power, and duties of officers.

In order to understand Philadelphia's present form of government, which only dates from 1919, it is necessary to contrast it with its predecessor. The period of "close corporate" existence, which form had been drafted by Penn in his charter of 1701, after English models, came to an end in 1789, when a modern municipal corporation was created. The history of the city's administration from this period down to its reorganisation in 1919 shows that it was impossible to obtain efficient government with a decentralised system, so long as the attitude of the citizens towards their municipalities remained what it was. The mayor, who was originally a member of councils, soon ceased to be so. The mode of his election also underwent radical changes. At first he was elected by the aldermen; this plan was followed by a system of election by councils; and it was not until 1839 that election by the people was introduced. Nor did the extent of his power remain the same. The period immediately succeeding the introduction of popular election of the mayor marks the greatest change in this respect. Up to that time the mayor had full power of appointment. He was now stripped of this. This was but the beginning of a movement which ended in the degradation of the office of mayor to little more than head of the police system. It received no definite check until the new charter of 1885 came into effect in 1887. The extensive power of appointment, as well as other less important functions, were gradually absorbed by city councils, which during the period under consideration had also undergone a change of organisation. In 1796 the legislative branch of the city government became bicameral; being divided into common and select councils. "They inherited the powers of which the mayor had been shorn, which gave to the local legislature a twofold character; combining within itself both executive and legislative functions." Its methods were that of government by standing committees. A long chapter of the very worst abuses followed, due to the entire lack of an adequate fixing of responsibility in municipal affairs. In 1854 the consolidation of the surrounding suburban districts with the old "city" took place. No changes in the methods of government were effected however, so that Philadelphia continued to suffer from an inefficient, extravagant, and corrupt administration, of which the history of the Gas Trust, so well described by Mr. Bryce in his *American Commonwealth*, is

but one instance. The agitation for a change in the form of government extends over a series of years, and after one defeat in the state legislature, the act for the "Government of Cities of the First Class" known as the Bullitt Bill, was passed in 1885, and came into effect on the first of April 1887.

The fundamental principles upon which this act is based are those which have found expression in almost all the attempts at the reform of city government in the United States within recent years. It is an attempt to definitely fix responsibility by greatly increasing the power of the mayor; giving to him all the powers of an executive, and taking from the councils as far as possible their executive functions.

The legal position of the American municipality in the state makes it necessary, in order to comprehend the city organisation in all its bearings, to examine the state constitutions, which generally contain provisions which may be regarded as complementary to the municipal corporation acts.

In this sense the Pennsylvania state constitution of 1873 served to pave the way for the radical reforms introduced by the act of 1885. It was hoped that a provision effectually prohibiting special and local legislation would be inserted. As a matter of fact we find such a clause in the state constitution,[1] but owing to the very liberal interpretation of the court as to the power of the legislature to divide the cities into classes, the object intended has not been attained, at any rate as regards Philadelphia. Philadelphia is the only city of the first class in the commonwealth, so that general legislation for cities of the first class is in reality special legislation as regards Philadelphia. A further provision of the state constitution which is of importance in the municipal system deals with the question of city indebtedness prohibiting a county, city, borough, or township from maintaining a debt in excess of seven per centum of the assessed valuation of the taxable property therein contained. But even this provision has shown itself of but little importance. It is only necessary for the city to increase the valuation of its taxable property, which in some cases has been done to the extent of 1000 per cent, in order to make the "seven per cent" extremely elastic. Furthermore the county, the city, the general school district, and the ward school district, have each the same power, so that in one city the actual indebtedness might be 28 per cent and still remain in absolute conformity with the legal provisions. The conditions are somewhat different in Philadelphia, where the city and county are co-extensive. Another important clause of the state constitutions is aimed to abolish one of the very worst forms of encroachment upon local self-government, viz., the practice of the state legislature to establish special state commissions entrusted with the execution of municipal improvements and the disbursement of the city revenue. Section 20 of Article iii. provides that "The General Assembly shall not delegate to any special commission, private corporation, or association, any power to make, supervise, or interfere with any municipal improvement money, property, or effects, whether held in trust or otherwise, or to levy taxes, or perform any municipal function whatever." Six further provisions are intended to protect the cities against state legislation on the one hand and local short-sightedness on the other. They may be classified as follows:

1st. Forbidding the state legislature to authorise any local body—be it county, city, borough, township, or other incorporated district—to become a stockholder in any corporation or association, or to lend its credit to such bodies.[1]

2nd. That no such local body shall be authorised to increase its indebtedness by an amount exceeding by two per cent the statutory seven per cent of the assessed property valuation without the consent of the electors at a public election.[2]

3rd. The state government is absolutely forbidden to assume the indebtedness of any local bodies unless such debt be incurred in the suppression of domestic insurrection or to repel invasion.[3]

4th. Upon contracting a debt every local body is required to provide for the annual collection of a tax, in order to meet the payment of interest and the liquidation of the principal within thirty years.[4]

5th. No municipal commission may incur any liability except "in pursuance of an appropriation made therefor by the municipal government."[5]

6th. Every city is required to create a sinking fund which "shall be inviolably pledged for the payment of its funded debt."[6]

With these restrictions and limitations in mind—which at the same time illustrate the American method of dealing with municipalities,—we are prepared to examine the actual provisions of the act of 1st June 1885, further amended by the act of 25th June 1919, which created for the city of Philadelphia, in many respects, a new form of government, or at least introduced into it new principles. As we have

[1] Act iii. § 7. "The General Assembly shall not pass any local or special laws, authorising the creation, extension, or impairing of liens; regulating the affairs of counties, cities, townships, wards, boroughs, or school districts; authorising the laying out, opening, altering, or maintaining of roads," etc.

[1] Constitution of Pennsylvania, Art. ix. § 7.
[2] *Ibid.*, Art. ix. § 8.
[3] *Ibid.*, Art. ix. § 9.
[4] *Ibid.*, Art. ix. § 10.
[5] *Ibid.*, Art. xv. § 2.
[6] *Ibid.*, Art. xv. § 3

already seen, the greatest change introduced into the form of city government was in the position of the mayor.[1] It is difficult to understand how the city fared so well under the old *régime*. The city departments were in no way co-ordinated. No unity of purpose and action was possible: continued rivalry and jealousy hampered any general movement for more economical and efficient government; and responsibility was so divided as to make it practically impossible definitely to fix it upon any one person or even one set of persons. This the new city charter has attempted to remedy through greatly increasing the power of the mayor. He is now the real executive of the city government, so that responsibility for the administration is centred in him. The act of 25th June 1919 carried the process of concentration of executive responsibility an important step beyond the act of 1885. Whereas the latter gave to the mayor the appointment of but three heads of departments, the new law gives to him the power to appoint, with the advice and consent of the city council, the heads of seven out of a total of eleven executive departments, viz. the director of the department of public safety, the director of the department of public works, the director of the department of public health, the director of the department of public welfare, the director of the department of wharves, docks and ferries; the director of the department of city transit, and the director of the department of law known as the city solicitor. Through the provision for a department of public safety the mayor has been relieved of what was formerly his main function —*i.e.* the police administration. Through his power of appointment and dismissal, he still retains the general control of this department. He is furthermore required to see that the ordinances of the city and the laws of the state are executed and enforced, to communicate to the council annually a statement of the finances and general condition of the affairs of the city, to recommend to the council all such measures as he shall deem expedient, to call special meetings of the council when required by public necessity, and "to perform such duties as may be prescribed by law or ordinance; and he shall be responsible for the good order and efficient government of the city." In order to make the latter provision effective he is given additional far-reaching powers. He convenes the heads of departments for consultation and advice, and calls upon them for reports; he is *ex officio* a member of all municipal boards, and has the power to dismiss any officer appointed by him. He may disapprove of any item of appropriation bills; whereas formerly he was limited to accepting or rejecting the budget *in toto* as voted by the councils. Whenever he thinks proper he may appoint three persons to examine the accounts of any city department, trust officer, or employee. The mayor is elected by the people for a term of four years, and is not re-eligible for the next succeeding term. He must be twenty-five years of age, and have been a citizen and an inhabitant of the state five years and an inhabitant of the city for the same period previous to his election. Besides the seven executive departments already mentioned, the charter provides for four further departments, making a total of eleven,—viz. the department of receiver of taxes, the department of city treasurer, the department of city controller, and the civil service commission. Of the total of eleven departments, it will be readily seen that the departments of public safety and public works, of which the mayor appoints the directors, are the most important. Under the former the entire police administration is placed, excluding the health police, which is under the supervision of a director of the department of health. The department of public works—whose director is also appointed by the mayor, with the consent of the city council for the term for which the mayor appointing him was elected, and until his successor is appointed and qualified —includes the management of the water- and gas-works owned by the city and the distribution of the same; the grading, paving, repairing of the public highways; the construction and repair of public buildings, with the exception of those used for educational or police purposes, bridges, parks, etc.; surveys, engineering, sewerage, drainage; and "all matters in any way relating to or affecting the highways, footways, wharves, and docks of the city."

The third important department, wherein the mayor exercises wide powers of appointment, is that of the department of public welfare in charge of a director appointed by the mayor. To this department is entrusted the management of charities, alms-houses, hospitals, houses of correction, and like institutions. In addition, the director of public welfare has charge of all public playgrounds, recreation centres, municipal floating baths, bathing grounds and recreation piers. The jurisdiction of the departments of public health, wharves, docks and ferries, of law, and of the

[1] The salaries of the more important officials in the city government are as follows:

The Mayor receives	$12,000
Director of Department of Public Safety	10,000
Director of Department of Public Works	10,000
City Comptroller	8,000
City Solicitor	10,000
Receiver of Taxes	10,000
City Treasurer	10,000
Three City Commissioners, each	5,000
Recorder of Deeds	10,000
Registrar of Wills, fees and	5,000
Sheriff	15,000

The last six offices are distinctively county and not municipal offices, but as the city and county of Philadelphia are co-extensive in area, all salaries mentioned above are paid out of a common fund.

city treasurer are sufficiently indicated by their titles.

The department of receiver of taxes is in charge of a receiver of taxes who is elected by the people every three years. All officers in any way connected with the receipt and collection of city taxes, licences or fees, are under his direction and control. The department of city treasurer is under the direction of a city treasurer who is also elected for a term of three years. He receives the moneys of all the other departments, and pays all warrants duly issued and countersigned. An important provision of the present charter, intended to correct many former abuses, is that "all the moneys . . . of the city received by any officer or agent thereof, shall be deposited daily in the city treasury."[1]

The most important of the financial departments is that of city controller, at whose head is placed an official elected for three years, and known as the "city controller." His functions are numerous, complicated, and upon their proper discharge depends, to a very great extent, the honest and efficient financial administration of the city. He is charged with the inspection, revision, and auditing of the accounts of the several departments and trusts. No warrant may be paid by the city treasurer unless countersigned by him. He has the financial control of the appropriations made by councils, and is personally responsible for any disbursements in excess of such appropriations. He has furthermore very important duties with regard to contracts. The department of law, which has charge of all the legal business of the city as well as the preparation of all contracts, has at its head a "city solicitor," elected for a term of three years. The sinking fund commission, created in 1857, and composed of the mayor, city controller, and a citizen elected by councils, has the management of the sinking fund for the payment of the city debt. The department of education has been made completely independent of the city government. It is managed by a board of education appointed by the court of common pleas, has general control of the educational system of the city, and enjoys a separate budget with sources of revenue independent of the power of the mayor and council.

We have now before us the executive branch of the city government, viz. the mayor and the various executive departments, the seven most important of which are directly dependent upon his choice for their executive heads. In this way the old departmental conflicts have been avoided, as the heads of these departments stand to the mayor somewhat in the same relation as the cabinet to the president of the United States. The position of mayor of Philadelphia has thus been raised to one of high honour and dignity, and it is hoped in this way to attract the very best of its citizens to the office.

Another very characteristic feature of the present city organisation is the position occupied by the legislative branch of the city administration, which consists of a city council elected by the local voters on the basis of one member for each twenty thousand voters. This system was inaugurated by the act of 25th June 1919. Prior to that time the legislative authority of the city was vested in a bi-cameral council, which system has worked most unsatisfactorily.

Prior to the adoption of the city charter of 1885, the inferior position occupied by the mayor found its complement in the almost unlimited power of councils. To correct the abuses growing out of the exercise of executive functions by the legislative branch was one of the main objects of the legislation of 1885. This purpose was carried one step further in the act of 1919. It aims at restricting councils to legislative, to the exclusion of executive functions. All ordinances directing or interfering with the exercise of the executive functions of the mayor, departments, boards, or heads or officers thereof, are prohibited. The council is furthermore deprived of all power of appointment, though the appointment of all officers drawing salaries from the city treasury requires its consent.

Inasmuch as the city of Philadelphia is coterminous with the county, the duties of certain county officers form a portion of the sum total of the administrative work of the city. These are the county judges, prothonotary, registrar of wills, recorder of deeds, clerk of quarter sessions, district attorney, coroner, and city commissioner. It has also been decided by the courts that the city treasurer and controller are to be regarded as county as well as city officers. These officers are all elected by the people at the fall election, whereas the election for municipal offices takes place in the early part of the year. To this rule the prothonotary forms an exception, as he is appointed by the board of judges.

In conclusion it may be said the changes introduced into the city government of Philadelphia by the act of 25th June 1919 have placed the administration of city affairs on a more efficient and business-like plane.

It is curious to note that while the principle of concentration of power is making itself so distinctly felt in American cities, some of the most efficient continental municipalities have been clearly tending towards a division of executive authority amongst a great number of bodies—committees and the like. It remains to be seen whether the American system which aims to give to the mayor a position of such

[1] Act, 1st June 1885, Art. vi.

great importance and authority, will be able to withstand the strain which the rapidly increasing sphere of municipal activity will necessarily place upon it.

[Dillon, John F., *Law of Municipal Corporations*, 4th ed., 1890.—Goodnow, F. J., *Comparative Administrative Law*, 2 vols., 1894; and the following in *Johns Hopkins University Studies*: Allinson and Penrose, *Philadelphia, 1682-1887*; Gould, E. R. L., *Local Government in Pennsylvania*; Howard, *Local Constitutional History of the United States*.—Hollander, J. H., *Studies in State Taxation*, 1900; *Financial History of Baltimore*, 1899.] L. S. R.

The economic disturbances of the World War have added greatly to the financial and administrative problems of the American city. Many maintenance and construction outlays, curtailed or suspended during the war years, have now become imperative. The costs of materials and services remain far above pre-war levels. National prohibition has taken away an important source of revenue, in the form of license-receipts. The capital value of real estate, upon which rests the prime burden of municipal support, has undergone sharp "deflation," and the taxable basis has been further affected by building inactivity. Credit conditions have enhanced the cost of municipal borrowing and have impeded the course of refunding operations. In the field of quasi-public services (gas, electricity, traction, telephone) the operating companies have suffered acutely from the increase in overhead and operating costs, as compared with the fixity of tariffs. Bankruptcy and disruption have been averted only by wholesale increase of charges. For some time to come the American municipality is likely to show the indirect calamity of war wastage in the form of restricted activities, oppressive charges, and accumulated indebtedness. J. H. H.

MUÑOZ, ANTONIO, is the *nom-de-plume* under which D. Enrique RAMOS (second half of 18th century) published his *Discurso sobre la Economía Política* (Madrid, 1769). His predilection for agriculture displays some leanings towards physiocracy; according to D. Manuel Colmeiro (*Bibl. de Economistas Españoles*) his opinions on cultivation, population, taxation, and trade show discrimination and a sound knowledge of theory.

It was once thought that MUÑOZ was a pseudonym of CAMPOMANES (*q.v.*), but this opinion has been abandoned. E. Ca.

MÜNSTER, SEBASTIAN (1489-1552), was originally a Franciscan monk, then a teacher at the universities of Heidelberg and Basle.

He wrote in 1540 a German, and in 1550 a Latin, edition of his *Cosmographia Universalis*, which remained a standard book until the 17th century was already far advanced. Roscher (*Gesch. der Nat. Oek.*, p. 96), describes it as a collective work remarkable for its encyclopædic aims, the accuracy of its information on foreign countries, and the real insight it displays into the economic condition of the latter. E. Ca.

MURATORI, LUDOVICO ANTONIO (1672-1750), born at Vignola (Modena), a great man in Italian history and literature. His life, first in Milan, then in Modena, was given to study. He was a priest, and the author of many writings, among which the most noteworthy are: *Antiquitates italicæ medii ævi*, Milan, 1738-1743; *Rerum italicarum Scriptores*, Milan, 1723-1738 (xxvii. vols.); and *Annali d' Italia*, Milan, 1744-1749. Recently the importance of Muratori in economics has been recognised. Many of his writings touch upon economics, in the numerous investigations they contain on the economic conditions of mediæval civilisation, the condition of industry, trade, agriculture, and colonisation.

From the point of view of theory, Muratori's ideas on economics are neither original nor profound. He does not understand the nature and character of the laws of value, and, above all, he falls into the grosser errors of mercantilism regarding money and commerce. He confuses the nature and economic use of money, and advises a prince, in order to make his country prosperous, to do all in his power to get as much money as possible into the country and let as little as possible go out. As regards commerce, he combats the prohibition of import of foreign goods, high import duties, and privileges granted to producers in a country to promote its industries. He also advises restrictive measures in the interior. Though failing to understand thoroughly the deeper phenomena of economics, Muratori's mind, better suited to the analysis of historical facts than to economic deductions, succeeds most in researches relating to economic and financial policy, grasping firmly the relations between civil and political institutions and social conditions. Thus Muratori points out the baneful effect of very large holdings, of entails, and of committing properties to trustees. He studied taxation, and went deeply into the question of charity. In his writings on charity he ascribed much importance to benevolent works carried on by the prince of a country to provide for the happiness of his subjects, and studied, from a practical point of view, the organisation of charitable institutions to enable them to attain the object desired. For economists, Muratori's most important works are: *Della carità cristiana* Modena, 1723. — *Rudimenti di filosofia morale*, Modena (undated, probably about 1735).—*Trattato della pubblica felicità*, Modena, 1749.

[On Muratori as a literary man and historian there is an entire library. On Muratori as an economist, see E. Masè Dari, *L. A. Muratori, come economista*, Bologna, 1893. — A. Graziani, *Le idee economiche degli scrittori Emiliani e Romagnoli*, Modena, 1893.] U. R.

MURDRUM. This term was applied in Norman times to any secret murder, when the

criminal could not be discovered. William I. found it necessary to prevent the assassination of his Norman followers by special penalties. It was accordingly enacted that if the body of a murdered man were found and the murderer was unknown, either it must be proved that the dead man was an Englishman, or else a heavy fine was imposed upon the hundred in which the body was discovered. This is sometimes called the law of Englishry. In course of time the term *murdrum* was extended from the offence to the fine levied on the district. By the time of Henry II. the distinction between Norman and Englishman had become so obscured by intermarriage that the law could no longer be enforced in the old sense. The only class that remained distinctly English was that of the VILLEINS, and therefore the *murdrum* was not exacted unless it could be proved that the dead man was a villein. As the motive which had led to the law had now disappeared, the penalty soon became obsolete.

[*Dialogus de Scaccario*, i. c. x.] R. L.

MURRAY, ROBERT (b. 1635), writer on trade, banking, and national revenue. His *Proposal for the Advancement of Trade* started from the position that as the circulation of money was stagnant and depressed trade, the circulation should be increased by using credit instead of money: storehouses on a kind of public pawnbroking basis were to be provided, in which traders were to deposit their "dead stock" at 6 per cent. per annum, and credit notes were to be issued on these goods at $\frac{2}{3}$ or $\frac{3}{4}$ of their then market value. Murray assumes that there will always be a steady market value for "dead stock" when convenient to the proprietor to sell. This assumption vitiates most of his economic suggestions. The *Proposal for the Better Securing our Woolf against Exportation* is based on a protectionist policy, and is a plea to revive and enforce the laws of the staples. All the unemployed are to be set to work, on a credit basis, in growing and working up wool, the object being to find a market by underselling and beating the foreign merchants out of the field. The *Proposal for a National Bank* was inspired by the basis, on public security and under public control, of the Bank of Amsterdam. Murray wished to see a similar bank established in the city of London, "so constituted that no little private sinister ends can possibly be advanced to the public detriment,"—he had failed to grasp the importance of the Bank of England established in the previous year (1694). Murray's bank was to be established on securities in land "or any other valuable securities or depositums"; it was to supply a public need, to remit money at safe and reasonable rates by means of cheques, and to discount bank, foreign, and inland bills. The *Reasons . . for Translating the Duty of Excise from Mault-Drinks to Mault*—a change which Murray considered would affect no one but the "consumptioner,"—is only worthy of notice owing to the plea for Free Trade towards the end. The government is asked to "take off all customs for import and export, except of such goods where the duty laid is intended to amount to a prohibition; this may make England become a free port, the great and good effects of which are too many and too obvious to stand in need to be repeated. This alone . . . will effectually secure our African and East India trade from any whatsoever competitors." In the *Proposal for . . . Advancing to the Crown any Fixed Sum*, etc. he suggests that the state shall issue bills of credit upon Tallies of Pro, struck upon a fund to be formed by settling some branch of the royal revenue to be charged by act of parliament with an annual payment for a limited term, *e.g.* £400,000 for eleven years, or £200,000 for twenty-two years, the bills to range in value from £5 to £100, and to be accepted as legal tender in trade, etc.

The following works were, so far as stated, all published in London:—

A Proposal for the Advancement of Trade upon such Principles as must Necessarily Enforce it, 1676, fol. pp. 7.—*Composition Credit, or a Bank of Credit made Current by Common Consent in London, more Useful than money*, 1682.—*Account of the Constitution and Security of a General Bank of Credit*, 1683.—*A Proposal for a National Bank, consisting of Land, or any other valuable Securities or Depositums; with a Grand Cash for Returns of Money, etc. . . . the whole to be under the Care, Inspection, Trust, and Controul of the Publick Authority, and Legal Magistracy*, 1695, sm. 4to, pp. 4 and 8.—*A Proposal for the Better Securing our Wooll against Exportation, by Working up, and Manufacturing the same. With the Method and Manner of Setting and Keeping the Poor in Constant and Full Employment. . . . Under the Government of such of the Principal Nobility and Gentry . . . who are willing to undertake so Good and Pious a Work*, n.d. (? 1695), sm. 4to, pp. 4.—*A Proposal for the more Easie Advancing to the Crown any Fixed Sum of Mony, to carry on the War against France; And Payment of the Debts Contracted thereby*, n.d. but probably 1696.—*Reasons Humbly Offer'd to the Honble. House of Commons, for Translating the Duty of Excise from Mault-Drinks to Mault; whereby may be Advanced to the Crown above Twenty Millions, for Carrying on the War against France*, n.d. sm. 4to, pp. 4 (another edition).—*An Advertisement for the more easy and speedy collecting of Debts*, n.d. For TALLIES see Papers, *Journal Statistical Socy.* vol. lxxv. part i. "An old Exchequer Tally."

MURRAY, WILLIAM. See MANSFIELD, FIRST EARL OF.

MUSCOVY CO. See RUSSIA CO.

MUSHET, ROBERT (1782-1828), entered the royal mint about 1804. He became a recognised authority on the currency question, (see BULLION COMMITTEE, REPORT OF), and gave evidence before the committees of the Houses of Lords and Commons which sat in 1819, on the resumption of cash payments.

His works comprise *An enquiry into the effect produced on the national currency and rates of exchange by the Bank Restriction Bill*, 3rd ed. corrected and enlarged, London, 1811, 8vo, in this a seignorage of 10 per cent on the silver coin is recommended, and an arrangement for the management of the silver currency.—*Tables exhibiting the gain and loss to the fund-holders arising from the fluctuations in the value of the Currency from 1800 to 1821*, 2nd ed. corrected, London, 1821, 8vo, the best history of the variations between the value of the gold coin and the paper in circulation at this period.—*An attempt to explain the effect of the issues of Bank of England upon its own interests, public credit, and county banks*, London, 1826, 8vo.

[*Dictionary of National Biography*, vol. xxxix. p. 430.—See also Ricardo, *Letters to M'Culloch*, ed. by Hollander, American Econ. Association, vol. x. pp. 111-113, 1895. Ricardo criticised the *Tables* and Mushet incorporated his suggestions in 2nd ed. 1821.—*Reports from, and evidence taken before, the Committees of the Houses of Lords and Commons on the expediency of the Bank of England resuming Cash Payments*, 1819.] H. MUTUAL INSURANCE. See INSURANCE, MUTUAL.

MUTUUM is one of the *real* contracts of Roman law. It is a contract of loan which is created by the lender delivering to the borrower a thing of an exchangeable kind, "*res fungibilis*" (see FUNGIBLES), such as money, so as to make the borrower owner of it, on the express or implied understanding that an equal quantity of the same kind of thing is to be returned. The lender cannot claim interest on the loan unless he makes a special contract distinct from the *mutuum*, entitling him to do so. It is distinguished from COMMODATUM, where the actual thing lent is the thing to be returned (see also LOAN, CANONIST DEFINITION OF). E. A. W.

APPENDIX

FACTORY ACTS.* The Truck Acts 1831-1896, though not classed as "Factory Acts," were yet designed to deal with certain evils common to industrial employments but not confined to them, *i.e.* the payment of wages in kind or by way of "truck," and the practice of making deductions from wages. These acts are not limited in their operation to persons employed in factories, but cover all persons employed in manual labour; miners, shop assistants, and waiters are examples of classes of persons (other than ordinary factory workers) enjoying their protection. Administration in mines and factories is in the hands of the inspectors of mines and factories and workshops respectively. No special arrangements have been made for administration elsewhere.

The history of factory legislation abroad is to a large extent but a repetition of the story that has now been told. In other countries, as in England, the pressure of competition, and the novel circumstances brought about by greatly subdivided labour and the increasing use of machinery, have necessitated some counter impulse to neutralise the worst evils which have everywhere been found to accompany the advantages of this great industrial change. In other countries, too, the counter impulse has been usually supplied from the central power of the state. As was also natural, the example of this country has been, in a great number of instances, closely followed at first, England being the country that not only had earliest made trial of the new experiment of the factory system itself, but on its greatest scale. Thus foreign factory acts have followed pretty closely the lines of English ones, commencing with partial legislation for only textile fabrics, and proceeding afterwards to other industries. But this rule is not universal. In some countries where remedial measures were late in being adopted, the course pursued has been of a more logical kind, and our more palpable errors have been avoided. Partly on account, no doubt, of the useful object-lesson which they provided; partly, also, from a greater freedom from that tyranny of precedent and mere words which is so marked a national characteristic here, they have in many cases kept themselves much clearer of inconsistencies and contradictions.

Prussia was the first country of Europe to adopt the principle of the English Factory Acts in a law dated the 9th March 1839, imposing certain restrictions on the employment of young persons and children in textile manufacture. Other states of Germany followed intermittently: Bavaria in 1840, Saxony not till 1861, the North German Confederation in 1869. It is the Industrial Code applying to the whole country, supplemented by State laws, that now corresponds roughly to the British Factory and Workshop Acts.

France was but little behind Prussia. The first Factory Act was enacted there in 1841. French labour legislation was codified in 1910 in the Code of Labour.

Sweden was comparatively early in the field (1846); Norway much later (1860).

Austria's Industrial Code was promulgated in 1859; Hungary's first legislation was in 1872.

Holland's first Labour Code is dated 1889. In Belgium some orders for the protection of women and children were issued in the 'nineties, but no law comparable to the British Factory Acts existed before the war.

In Switzerland a few cantons led the way in 1862; the first Federal Factory Act was adopted in 1877.

Both Italy and Spain adopted legislation for the protection of women workers early in the twentieth century. Portugal made a beginning in 1888. In Russia a Factory Act was adopted in 1881.

In the United States of America no general system is possible, since the Constitution reserves factory legislation to the states. The different states have very different standards, but all protect women workers and children, and regulate hygiene in work places and accident prevention to some extent.

In India the first Factory Act was dated 1881; the law has recently been amended to conform to the standards set by the International Labour Conference of 1919.

In Japan the Factory Act of 1911 is likewise now undergoing revision.

In Australia all States have Factory Acts or Codes mostly based upon legislation of the latter part of the nineteenth century, supplemented by standards fixed by determinations of wages boards or arbitration courts.

The New Zealand Factory legislation dates from 1891, the South Africa Factory Act from 1918.

A considerable impetus has been given to industrial legislation in certain countries by means of the conventions and recommendations adopted by the General Conference of the International Labour Organisation of the League of Nations created under the Treaty of Versailles. This conference, which holds meetings "from time to time as occasion may require, and at least once in every year," has already met on four occasions—in Washington (1919), Genoa (1920), and Geneva (1921 and 1922). The draft conventions and recommendations adopted cover a wide field both of industrial, agricultural, and maritime employments. Examples are as follows: child labour in industry, agriculture, and at sea; night work of women and children in industry and agriculture; the eight-hours day in industry; compensation for shipwrecked seamen, and facilities for finding employment for seamen; protection of women workers in industry and agriculture before and after childbirth.

The countries represented at these conferences undertake to present the draft conventions and recommendations "before the authority or authorities within whose competence the matter lies for the enactment of legislation or other action." In certain countries existing legislation was little, if at all, behind the standard of the draft conventions. In others it was far behind. An example may be given in the varying minimum ages at which the industrial employment of children is legal, the object of the draft convention being to create an international minimum of fourteen years of age. FARMERS' ORGANISATIONS IN THE UNITED STATES.*

The Political Undertakings of the Farmers' Alliance.—In 1890, at Ocala, Florida, it was decided that the Alliance should go definitely into politics. During the years preceding, a fairly definite programme of action had been formulated. At St. Louis a platform had been adopted, modified at Ocala in 1890, and at Indianapolis in 1891 it assumed the following form:—

"1. (*a*) We demand the abolition of national banks.

(*b*) We demand that the government shall establish sub-treasuries in the several states which shall issue money direct to the people at a low rate of tax, not to exceed 2 per cent per annum on non-perishable farm products, and also upon real estate, with proper limitations upon the quantity of land and amount of money.

(*c*) We demand that the amount of the circulating medium be speedily increased to not less than $50 *per capita* (say £10).

2. We demand that Congress shall pass such laws as will effectually prevent the dealing in futures of all agricultural and mechanical productions; providing a stringent system of procedure in trials that will secure prompt conviction, and imposing such penalties as shall secure the most perfect compliance with the law.

3. We condemn the silver bill recently passed by Congress, and demand in lieu thereof the free and unlimited coinage of silver. [The Silver Bill condemned was that of 14th July 1890, providing for the purchase of 4,500,000 ounces of silver bullion per month.]

4. We demand the passage of laws prohibiting alien ownership of land, and that Congress take prompt action to devise some plan to obtain all lands now owned by aliens and foreign syndicates; and that all lands now held by railroads and other corporations in excess of such as is actually used and needed by them be reclaimed by the government, and held for actual settlers only.

5. Believing in the doctrine of equal rights to all, special privileges to none, we demand—

(*a*) That our national legislation shall be so framed in the future as not to build up one industry at the expense of another.

(*b*) We further demand a removal of the existing heavy tariff tax from the necessities of life that the poor of our land must have.

(*c*) We further demand a just and equitable system of graduated tax on incomes.

(*d*) We believe that the money of the country should be kept as much as possible in the hands of the people, and hence we demand that all national and state revenues shall be limited to the necessary expenses of the government economically and honestly administered.

6. We demand the most rigid, honest, and just state and national governmental control and supervision of the means of public communication and transportation; and if this control and supervision does not remove the abuse now existing, we demand the government ownership of such means of communication and transportation.

7. We demand that the Congress of the United States submit an amendment to the Constitution providing for the election of United States senators by direct vote of the people of each state."[1]

Political Action.—The Alliance went boldly into the political arena, became a third party, nominated candidates for Congress and the

[1] *The Farmers' Alliance*, H. R. Chamberlain, p. 44. (The last paragraph was added later.)

presidency, and apparently held high hopes of winning the election of 1892. The presidential convention was held at Omaha, under the name of the People's Party, and General James B. Weaver of Iowa nominated for President. General Weaver had, in 1880, been the nominee for the presidency on the Greenback ticket, and the Alliance in a real sense was a continuation of the same sentiment.

The party met with disaster at the polls, though it carried four states, Kansas, Colorado, Idaho, and Nevada, with other scattered strength making 22 votes in the Electoral College. About 1,200,000 popular votes were cast for the People's Party altogether. The platform was almost identical with that quoted above, the land plank being emphasised by the introductory phrase: "The land, including all the natural resources of wealth, is the heritage of all the people, and should not be monopolised for speculative purposes, and alien ownership of land should be prohibited." The whole platform consists of three main parts, relating respectively to money, land, and transportation. The Alliance went out of existence during the period of the People's Party and the Populists.

Business Efforts.—The Alliance, and the constituent associations out of which it was made, were determined to solve the economic ills by direct and immediate action. They followed nearly the same path that the Grangers had followed a decade earlier. State purchasing agents were employed, and business through them ran into millions of dollars. Stores were started in many places, and while they had the usual hard experience of farmers' stores, they succeeded, nevertheless, in many instances. There are still in existence in Texas, Kansas, and other states, stores which were organised by the Alliance. That many of these stores resulted in important savings cannot be doubted. Often the results were indirect, but as important as though direct.

Another line of effort was the establishment of farmers' elevators. Few of these proved to be on a permanent basis, yet some of them survived, and later served as the inspiration and model for the co-operative elevators which have become so numerous.

A great deal of co-operative buying and a small amount of selling were done by Farmers' Alliance groups for some years, mainly from about 1888 to 1895. The purchases consisted of bulk shipments of twine, fertiliser, feeds, seeds, and the like. The sales were of farm produce, but aside from the sale of grain through the elevators and cotton through exchanges, they assumed no great proportions. These transactions were in addition to the business done through state agents. The work of the latter centred in general farm and family supplies, mainly groceries and machinery. That savings were effected is certain. The transient character of the business is explained mainly by the impatience of the farmer in awaiting results, by the lack of understanding of the middleman function, by the belief that most economic problems are capable of political solution. The immediate economic programme was merged in the political programme in the belief that the latter comprehended the former, and must be solved first, after which details would take care of themselves.

The American Society of Equity.

The society was organised at Indianapolis in 1902. There may have been similar groups already in existence out of which it was made, but the usual statement will suffice that it was started in the office of a publication called *Up-to-Date-Farming* in 1902. The society grew rapidly for a time, membership being given with subscriptions to the paper. The editor of the paper wrote a book, *The Third Power*, in which the principles advocated by the society are expounded. The outstanding features of the society in its early years were a belief that production had outrun marketing; that farmers could influence prices by deciding what produce ought to bring, and holding for that price; that little was to be gained through politics. Two campaigns were waged during the first seven years of the history of the society.

The Tobacco Campaign.—A fight between tobacco growers in Kentucky and buyers representing the American Tobacco Company became bitter. The American Society of Equity undertook to help the growers, and met with success for a time. The campaign lasted until 1909, after which the Equity virtually withdrew.

The Wheat Campaign.—This was much less definite than the tobacco campaign, and consisted mainly in an effort through exhortation to get a fair price for wheat. Since wheat had been selling at 70 cents or less per bushel, it was felt that a dollar would be satisfactory, and "dollar wheat" became the watchword. Within a few years, wheat reached the dollar mark, but since other prices had risen correspondingly it was not clear that the Equity had brought the increase in wheat prices to pass. At all events the farmers were by no means better satisfied with a dollar than they had been with 70 cents.

The Equity Reorganised.—In 1907 the Equity was reorganised. The extravagant claims as to membership were abandoned. It had been claimed that they had a million members. In reorganising, it transpired that they had perhaps 150,000 members, but that they were not bound together for any definite programme. The new society put its membership on a definite basis, adopted a programme, mainly that of aiding in the organisation of co-operative

companies and exchanges, and took an active part in politics in a non-partisan way. The main strength of the Equity since 1907 has been in Wisconsin and to the West as far as Montana. Recently the society has had hard work to maintain itself against the more aggressive Non-Partisan League and the rapidly growing American Farm Bureau Federation. The highest point reached in membership for any one state was approximately 40,000 in Wisconsin about 1920. Since then there has been a decline.

The Farmers' Educational and Co-operative Union.

This organisation began in Texas in 1902. The immediate cause of the movement was dissatisfaction with the methods of marketing cotton and the price received for it. The growth of the Union was slow until 1906. At that time an elaborate constitution was adopted and a programme announced. The main thought around which the programme centred is expressed in the purpose "to secure and maintain profitable and uniform prices for grain, cotton, live stock, and other products of the farm." The Union has, with the exception of the first few years, been a much larger organisation than the Equity. Its programme has been similar, but more comprehensive. The Union has passed through several phases in its efforts to bring order out of chaos.

The first campaign was one of price fixing. Not the price fixing of authority, since it had none, but the price fixing, or price naming, of a large group hopeful that the setting of a price in this manner would result in withholding from the market of a sufficient part of the supply to compel the payment of the promulgated price. For a year or two this plan seemed to work well. The price named was apparently about what the market was able to stand, and the Union felt that it had won. Encouraged by the supposed success, a price was set in 1907 quite above the market figures. To the disappointment of the Union, this venture failed dismally. The price set was 15 cents, but the cotton was sold at 10 to 12 cents. The next year a more modest effort was made at price control, but the actual selling price was below the figure set by the Union, and it became painfully evident that markets were not controlled by proclamation. There was too much cotton from the standpoint of committee-made prices.

Control of the Supply.—Seeing that prices could not be set at will, the Union undertook to control the supply. In fact this had been attempted by earlier organisations, and had been adopted as a part of the Union programme almost from the beginning. In 1905 an attempt had been made to reduce acreage, and since the price was low, it was not impossible to dissuade farmers from growing the usual amount of cotton. While this could be done once, in the language of a Farmers' Union leader, "Whenever we tell the farmers to grow less cotton they grow more," thinking that at the time of a short crop it will pay individually to have a large amount.

Warehouse and Credit Plans.—It became evident that farmers could not hold cotton off the market for a higher price merely because they were asked to do so, or even if they wished to do so, without additional facilities for marketing. Warehouses were woefully inadequate, and a lack of ample credit had long been a great drawback to the cotton farmer. The Union went to work to better the situation in these respects, and succeeded in promoting the erection or purchase of a large number of warehouses, possibly 1500. The need for these warehouses was acute. Cotton has been badly handled so far as exposure to weather is concerned, but of still more importance the lack of facilities for storing meant corresponding lack of credit based on cotton as security. An improvement in both these respects has resulted from the efforts of the Union.

Behind all these difficulties, as shown by the work of the Union, were more fundamental troubles. The cotton growers are largely tenants, with very limited means. Hence no marketing reforms could hope to solve all of the economic ills of the people involved. More fundamental treatment is clearly demanded. This the Union has come to see, and has concerned itself with matters of education, farm credit, land tenure, and political matters relating to agriculture.

Business Undertakings.—The Union has fostered co-operative buying and selling, the establishment of stores, exchanges, and the like, from the beginning. The most outstanding instance of the kind is the Farmers' Union Exchange of Omaha, Nebraska. This exchange deals in all manner of farm supplies—groceries, coal, farm machinery, farm seeds, clothing for everyday wear—running into several million dollars per year.

A series of live stock commission houses has been established, some seven in number. Co-operative stores have been organised in considerable numbers, probably, all told, a few hundred. Aside from these, fertiliser plants and cotton gins are co-operatively owned in many instances.

The Farmers' Union has a membership of perhaps half a million, with state organisations in about twenty states, mostly in the South and West.

The Non-Partisan League.

The Non-Partisan League had its origin in North Dakota about 1915. It has spread to

a large number of states, mostly north-central and western, and claims a membership of 200,000.

The occasion for this uprising is fairly clear: North Dakota is almost exclusively an agricultural state. It has depended mainly on grain growing and selling as its source of income. Around the grain business has grown up a great deal of suspicion. The central market to which grain is shipped from North Dakota is in another state. The railroads running through North Dakota are owned elsewhere. The elevators through which the grain makes its start to the central market were owned in other states, and the sentiment thereby developed still persists. The money for financing the movement of grain comes from the outside. The banks of North Dakota get a large part of their funds from Minnesota. It was often said that North Dakota was a province of the "Twin Cities" (Minneapolis and St. Paul).

In addition to the foregoing, it must be noticed that North Dakota is subject to droughts, and not a decade goes by without several serious partial crop failures. Just as important is the fact that the farm population of North Dakota is made up largely of Scandinavians, Germans, Russians, and other elements not long in America. These people took little interest in politics for many years, and it came to be believed that the political affairs of the state were run largely by outside, selfish interests. It is therefore easy to see how intelligent people, such as these are, may, after years of patient submission, become overwrought and finally are awakened to the belief that they are being imposed upon.

A man with remarkable organising ability, after having made a failure in large-scale farming, conceived the plan of forming the League, getting control of the state, and inaugurating a new economic régime. The plan was to induce the farmers to join for two-year periods at a time, paying dues at first of $4 a year, afterwards, $9. Thus was to be raised a campaign fund, the immediate use of which was to maintain and extend the organisation, and particularly to capture the state politically, so as to institute the proposed economic programme. Few such harvests have been available to organisers. They received at least $4 a member, and the work of soliciting during several years was almost nothing.

The Economic Programme. — The Non-Partisan League has been outstanding in its demands. The founders believed in state action over a large field. The main demands, by no means all, are:

1. State ownership of terminal elevators, flour mills, packing houses, and cold storage plants.
2. State inspection of grain and grain dockage.
3. Exemption of farm improvements from taxation.
4. State hail insurance on the acreage tax basis.
5. Rural credit banks operated at cost.

Within four years the League had complete political control of the state. As the above programme suggests, the League was a protest against the practices of elevators, mills, packing plants, grain exchanges, insurance companies, and banks. It was the "common people" uprising against "the interests," more drastic than anything previously attempted. The state was in the hands of the League, even to the courts, during the years 1917 to 1921.

The distinctive feature of the Non-Partisan League, so far as economic programme is concerned, is its reliance on state action as opposed to voluntary co-operation. Faith in the latter method of solving marketing difficulties is weak among members of the League, due, it is alleged, to the lack of success of the Equity Society to establish a dominating co-operative grain exchange. That co-operation has succeeded admirably among grain producers in Canada does not impress them. Probably the fact, even though it be an incidental one, that the League leaders were socialists, accounts in large measure for the bent toward state activity.

In October 1921, at a recall election, the League state officers, governor, attorney-general, commissioner of agriculture, and treasurer, were all recalled and their places filled with opposition candidates. Curiously enough, the programme of the League was tacitly upheld, *i.e.* it was not voted down, at the same election. This shows a divided opinion among the voters concerning the programme and the leaders.

During the years 1917 to 1921 the state of North Dakota under League rule established a state bank, which is doing a considerable business, and has a mill and elevator plant under construction. Also a small flour mill was purchased, and has been under state operation for several years. The reports concerning the bank are conflicting and difficult to analyse. There was a genuine reason for the banking venture. That the matter has been well handled is not clear. The flour mill is a small affair, and has been in operation during a time when it is difficult for the best of mills to make a good showing. Discouragement and distrust seem to have overtaken the men and measures involved in the new programme before it had been running long enough to demonstrate either its strength or weakness.

Political Programme.—It is the avowed purpose of the League to get control, in a non-partisan way, of as many state governments as possible. Just what is to be done in the way

of programme is not clear. It is assumed that with the farmers, assisted by the labourers, in control, whatever needs to be done can be done. Hence specific promises are not altogether necessary.

The spread of the League into many states, which appeared to be very rapid for a time, is greatly curtailed by the rise of the American Farm Bureau Federation. While the programmes are very unlike, there is little probability that any considerable number will support, for any long period of time, both organisations. The Farm Bureau is on the ascendancy, and the League appears to have passed its zenith.

THE AMERICAN FARM BUREAU FEDERATION.

The causes of the Farm Bureau movement were similar in most respects to those of the earlier movements. The feeling was strong that something in an organised way could be done, particularly with respect to improved marketing. This feeling had resulted in the efforts noted above, but the results were not sufficiently gratifying to induce the farmers to put unlimited confidence in any one of the organisations. The means by which the Farm Bureau was brought into existence, and almost at once made nation-wide, was at once unique and unpremeditated. It came about through the county agricultural agents.

The County Agents and the Farm Bureau.—Beginning in the South in 1902, and later, about 1910, on a different plan, the county agent system spread substantially over the country. It was given a great impetus by the war, several states during 1917 and 1918 completing the quota of an agent for each county. In the early years of county agent work, marketing received almost no attention. The view was expressed even to the effect that the agent ought to keep distinctly out of the marketing field. This sentiment probably grew out of the situation arising from the fact that a large number of business men took an active part in establishing the county agents, often raising a sum of money toward the expenses the first year or two. The business men are to a large extent doing the middleman part in marketing, and were not anxious for reforms. It seemed to them that the thing needed was greater and more economical production.

In a large number of states the local support for the county agent consisted of a group of citizens, mostly farmers, who came to be called the County Farm Bureau. The first of these bureaus was in Broome County, New York, and was supported by funds from the Binghampton Chamber of Commerce, the Lackawana Railroad, and the United States Department of Agriculture. It soon developed that counties made appropriations, state aid was given, and the city and private support lapsed because no longer needed. The main direction was eventually vested jointly in the local boards, or bureaus, and the state colleges of agriculture.

State Farm Bureaus.—It was very natural that out of the county bureaus should come the idea of a state bureau. At first the purpose of the state organisation was not very clearly defined. The work of the county agent had not been any too well defined. It involved every sort of art and science connected with agriculture. The early state gatherings of county bureaus were entirely informal. They came together frequently with the county agents at an annual meeting of the latter at the colleges, often on the occasion of Farmers' Week. Out of these gatherings grew associations for the purpose of unified support of the local bureaus and agents. Later they assumed a more formal character. The first real state bureau seems to have been organised in West Virginia in 1917. Two years later, in New York, the question of a national bureau was broached. The purpose of the organisation proposed at Ithaca, New York, in 1919, was "(1) to provide the nation with some sane organisation thoroughly representative of agriculture throughout the entire United States, which might speak for the farmers of the entire country; (2) to take advantage of a nation-wide organisation—the Farm Bureau—which promises great possibilities of usefulness in developing a programme which will reach the entire country and which will bring into action the strongest farmers of the nation." This appeal met with great response and stimulated the establishment of the very bureaus it proposed to federate.

The National Organisation.—In November 1919, at a meeting held in Chicago, the American Farm Bureau Federation was formed. At this meeting the great majority of the delegates were from the Middle West, the Middle Atlantic, and New England States, though all sections were more or less represented. At the outset there was a difference of opinion as to policy. One group wanted an organisation which should act as an educational clearing house. Another group wanted co-operative business units formed for the marketing of produce. The latter plan prevailed.

The programme adopted as a guide in the work to be undertaken is as follows:

"GENERAL.

To develop a completely unified national organisation to act as spokesman for the farmer and to adequately represent the farmer and the farmer's interests on all occasions.

EDUCATIONAL.

1. To create in the urban mind a better conception of the farmer's relationship to other units in the social and economic structure.

2. To re-establish agriculture in the public mind as the foremost industry, on which all others depend, and in the prosecution of which man reaches his highest plane of development.

3. To encourage and assist in the development of food production to its highest state of efficiency.

4. To foster and develop all those lines of endeavour which make for better homes, better social and religious life, better health, and better rural living in every sense.

5. To conduct referenda on various national questions to determine farm sentiment before determining legislative action.

LEGISLATIVE.

1. To safeguard the rights and interests and to assert the needs of the farmer whenever occasion may arise.

2. To establish without question the legality of collective bargaining.

3. To insist upon the presence of 'farmer minds' on all boards and commissions affecting agriculture, appointed by Congress or the President.

4. To defend the farmer's view-point in all matters relating to tax levies, tariffs, currency, banking, railways, highways, water-ways, foreign markets, the merchant marine, territorial acquisitions, and all similar legislative matters involving questions of policy, in any way affecting agriculture.

5. To insist on some arrangement between capital and labour which will insure freedom from disrupting and criminally wasteful strikes.

6. To strengthen the Federal Farm Loan Act and secure in addition the establishment of a system of personal credits.

7. To demand the regulation, under government supervision, of all commercial interests whose size and kind of business enables them to establish a monopoly dangerous to the best interests of the nation.

ECONOMIC.

1. To extend co-operative marketing of farm crops to the point in the distribution system that the maximum benefits are secured for the producer, and, incidentally, for the consumer.

2. To limit the profits and reduce the costs of distribution in all lines not handled co-operatively.

3. To so estimate the effective world supply of any farm product and to so regulate the flow to market as to eliminate sharp and extreme price fluctuations.

4. To establish new foreign markets for surplus American farm products.

5. To provide cheaper sources of fertilisers and more economical means of production."

The budget of the national organisation for 1921 was almost a half million dollars, while many states had federations handling amounts of money nearly as large. The programme of the Farm Bureau provides for the organisation of the producers of given commodities into marketing groups, with substantial independence of action in all essentials. The first of these commodity-organisations to get under way was the United States Grain Growers Inc. This organisation provides as its main features a national sales agency, local co-operative units, and contracts between growers and local units, and between the local unit and the national sales agency.

The U.S. Grain Growers Inc. is to provide:

"(*a*) Terminal sales agencies at the various markets.

(*b*) Warehouse facilities at terminal markets.

(*c*) A finance corporation.

(*d*) An export corporation.

(*e*) A market news service.

The grower at the time of signing the contract is given the choice of three ways of making sales:

1. Individual Sale.

(*a*) For cash at a price offered by the Elevator Company.

(*b*) By consignment through the Elevator Company to the National Sales Agency—control of time of delivery, shipment, and sale to remain with the grower.

2. Pooling Method.

(*a*) Local pool.

(*b*) Joint pool.

3. Export Pool.

(*a*) Grower may elect to pool one-third and sell remainder in accordance with other plans permitted."

A great deal of difference of opinion has prevailed concerning pooling. One faction led by genuine radicals wants nothing short of complete, compulsory pooling, whereby the sales agency would have control of the supply of grain to such an extent as to have price-making power. While the pooling plan failed to carry in this extreme form, it was agreed that organisers should undertake to induce growers to pool at least one-third of the crop in the export pool, thus insuring control of the surplus. At present, April 1922, although fifty to seventy-five thousand farmers have signed contracts, it does not look as though an effective export pool, from the standpoint of price control, is probable. A branch of the organisation is provided for handling the financial matters involved in grain marketing. The capitalisation is $100,000,000. The individual membership in the United States Grain Growers Inc. is $10.

Similar organisations are being formed for handling other commodities. Committees have been appointed, and in some instances have reported, on the marketing of live stock, of fruit, of dairy products, and of wool. The plans are being formulated rapidly, and the

American Farm Bureau Federation is destined to play a major rôle, for a time at least, in the main operations of agricultural marketing.

The Farm Bureau and Politics.—It is the intention of the Farm Bureau to stay out of politics except with respect to such matters as affect agriculture, and are not being taken care of satisfactorily by the usual political procedure. There is no intention of putting tickets or candidates into the field. Almost at the beginning the officers of the Bureau went to Washington to acquaint themselves with the political situation, and without doubt began at once to exert an influence. A Washington office was promptly established and a representative stationed there. He has been a busy man, finding much to do in connection with legislation directly or indirectly affecting farmers.

The most distinctive outcome of the relation of the Farm Bureau to politics thus far is its influence in uniting, irrespective of party lines, a group of senators and representatives into what is known as the "Agricultural Bloc." In the Senate there are about twenty-two members of the bloc; in the House the number is nominally larger, but not so definitely committed to a policy. The permanence, or the solidarity, of the bloc is to be determined. It has the appearance of strength and determination, but until it has been held together through the trials of a few elections its relation to party alignment cannot safely be predicted.

Similarity of the Farm Bureau to other Movements.—The question is very properly asked, Is, or is not, the Farm Bureau merely another one of a considerable number of uprisings of farmers against more or less vague grievances? If it is about like the rest it is reasonable to expect that it will run a course much like that of many of its predecessors, and in the end leave the problems but very partially solved. Undoubtedly the Farm Bureau owes its origin in large part to the same general conditions which resulted in the former efforts of farmers to better their relations to other groups. It is true prices were high when the Farm Bureau was started, and it might seem that the farmers had done the unusual in attempting to improve what was already good. However, it was evident that prices were not safe at the high level, that is, they were expected to fall to some lower level shortly, and, of more importance, the farmers felt that relatively they were being discriminated against indirectly, and probably unintentionally, by the government, but more particularly that the struggle for income was assuming unequal proportions. The redistribution of wealth due to the war had been brought about to the detriment of the farmer. The movement was an effort to rectify wrongs already perpetrated, and to get such control of the business of marketing as to prevent further abuses. The most significant cause of the Farm Bureau movement must not be forgotten. It was undoubtedly the existence of the local and state bureaus. Hence the organisation of the national society in 1919 and 1920 was not due immediately to the conditions of the time so much as the opportunity. It was looked upon as an opportunity to rectify the long-standing abuses of the markets, and in connection with, and in addition to, marketing reforms to make the influence of the farmer felt in the affairs of the nation. Thus the origin of the Farm Bureau is quite unlike that of other movements, but at the same time has many points in common with them.

The Farm Bureau grew up, as it were, spontaneously in nearly all parts of the country at the same time. The seed had been planted, no doubt without a clear understanding of its nature. At all events the county agent, county bureau, influences have much to do with the result. The long-desired opportunity to unite all the farmers into one organisation seemed to have come. The Grange, the Farmers' Union, the Equity, the Non-Partisan League were all distinctly limited as to the area covered. They were, or appeared to be, limited in their interests; some are secret societies, some are not primarily economic. There was no hope of uniting these organisations into an effective federation. It had been tried and the results were disappointing. Hence the only visible way of progress was along a new path, and the Farm Bureau was the organisation formed to find it, or make it.

What the relationship of the Farm Bureau to the other organisations will ultimately be is not thus far clear. It would seem likely that it could get along amicably with the Grange, since the latter is well established and has a sphere of influence not covered by the Farm Bureau. The case is not so clear when an organisation like the Non-Partisan League is considered. At present both organisations seem strong in certain states. That they can both maintain their positions and strength does not seem probable. Both are trying to do the same things to a great extent, and the spheres not mutually covered are probably not of the enduring type. Hence if both succeed a clash is imminent.

In comparing the Farm Bureau with other farmer movements it must not be forgotten that one of the greatest differences is found in the type of men employed and the manner of going into new lines of work. The earlier organisations were almost devoid of any sense of limitations regarding their ability to handle whatever sort of business they were tempted to go into. Investigations were not appreciated and never attempted. The Farm Bureau has thus far shown a disposition to gather informa-

tion from whatever source available, and to employ men who are skilled in the line of work to be undertaken. While not always fully realised the difference in plan is fundamental. It is in contrast with the view so long prevalent among farmers that the work affecting their interests must be done by some of their own members. That farmers have men with good enough brains to do any of the work in question need not be argued. That they have men of sufficient training and experience is quite another matter. Farming and marketing may be classed as parts and parcels of a completed whole, but most farmers are not trained in marketing methods, and those who do understand marketing usually do not, and need not, be informed on the technical details of producing crops or animals.

The Co-operative Movements.

While no attempt will be made to discuss the many forms and instances of business co-operation built around commodities as a centre, it seems advisable to mention the fact that some of these efforts were essentially like the farmer movements outlined above. Not forgetting that co-operative marketing has been an essential of all farmer movements, it may be noticed that in some instances groups of farmers united only through membership in co-operative companies have exerted an influence quite like that of the more pretentious groups. The most widespread of these groups was that of the grain elevators. Co-operative elevators had been tried before, but in 1902 a new start was made, and within twenty years there were 4000 such companies. State associations were formed in all the leading grain-growing states, and in 1912 a National Council of Farmers' Co-operative Grain Dealers' Associations was formed. These associations exercised much influence with certain legislatures, and especially with the Interstate Commerce Commission.

One of the outstanding co-operative movements is that of fruit-marketing, the greatest example of which is the California Fruit Growers' Exchange. This organisation handles successfully the bulk of the citrus fruit. Other instances of co-operative fruit-marketing are numerous.

In marketing dairy products co-operative companies were early in the field, that is to say, they began during the 'seventies and 'eighties. During recent years there have been many attempts at federation. It has made a beginning in butter-marketing, has made real progress in cheese-marketing, while in liquid milk-marketing, producers' companies are important factors around nearly all cities.

Live Stock Shipping Associations begun in 1908 had already, before the Farm Bureau undertook to become the dominating force among them, spread to all the leading live stock shipping states, and increased to 3000 or 4000 in number. Their success is proof that something of the kind was needed.

Conclusions.

In taking a bird's-eye view of the various farmer movements, and the co-operative developments so similar to them, one is impressed with the fact that it is assuming the aspect of a class struggle. The farmers are conscious of a common interest as they meet other organised forces in Congress, in state legislatures, and in the markets. The opposition is unified. The farmers are seldom unified, at least not clearly so, and not at all times. It may amount to unification when, for instance, the Agricultural Bloc is induced to exercise its balance of power in favour of legislation demanded by farmers in general, as the legislation favouring co-operation passed in 1922. The opposing forces are not a unit set over against the farmers. Whether they will ever become such depends on the strength of the farmers in forcing the issue. It appears like an incipient rebellion of the farmers against the industrial, the city, interests. The difficulty in uniting the farmers, and holding them, has in the past been insurmountable. The industrial interests can look out for themselves without one all-inclusive fighting body. For instance, the coal interests can take care of themselves without much help from the woollen manufacturers; the agricultural implement manufacturers do not need to unite with the packers. Likewise the growers of oranges or grapes do not need a great deal of help from the dairymen; the producers of milk are not likely to gain signal victories by combining with the cotton growers.

The Farm Bureau is undertaking to avoid the illusions of a "united front" all along the line of farm production and marketing, and at the same time to federate all interests so as to bring irresistible influence to bear on the questions which do pertain to all. It is a herculean task. To the extent to which it succeeds it will be evident that the farmers are doing the same thing which the labourers have been working at for a century, and which the capitalists, because of greater strength, do not need to do so conspicuously. The farmers are recognising the patent fact that they are to look after their own affairs or they will be managed to the advantage of somebody else. Exactly how the farmers are eventually to organise in the interest of their own welfare is not yet evident, but that some sort of organisation is demanded must be recognised by any student of the situation.

FARRER, THOMAS HENRY, Lord (1819-1899), educated at Eton and Balliol, was called to the Bar, and after temporary employment in the legal department of the Board of Trade was appointed Assistant Secretary of its Marine Department, 1850. He was Permanent Secretary of the Board from 1865 to 1886. He played a leading part in framing the Merchant Shipping Consolidation Bill, 1854; the Merchant Shipping Code, 1870; the Bankruptcy Act, 1883; and his active influence made itself felt in the legislation affecting the regulation of railway, electric lighting companies, etc., during his official career. He rendered notable service upon Royal Commissions, especially the Gold and Silver Commission and that upon the Financial Relations of Great Britain and Ireland. After his retirement he joined the London County Council (Alderman, 1889; Vice-Chairman, 1890). He was made a baronet in 1883 and a peer in 1893.

An ardent controversialist, Farrer was rather the uncompromising advocate than the judicial critic of the causes which he championed in his published writings. He was a fervent Free Trader, Chairman of the Cobden Club, 1899, a strong supporter of the Gold Standard, and one of the founders of the Gold Standard Defence Association, and favoured the grant of full financial independence to Ireland. His principal writings are: *Free Trade versus Fair Trade*, 1882 (3rd edition 1886); *The State in Relation to Trade*, 1883; *Mr. Goschen's Finance (1887-1890)*, 1891; *Retaliation and Commercial Federation*, 1892; *Studies in Currency*, 1898; *What is a Bounty?* 1899. H. H.

FEMALE LABOUR.* The following table shows the changes in the proportion of females occupied in certain industries in England and Wales during the last sixty years. The only decreases, in laundry service and lace manufacture, are due to the increasing use of machinery in these trades. The increase in stationery and paper-box, etc., makers and dealers, boot, etc., makers and dealers, and tobacco manufacturers and tobacconists is in each case considerably greater among the dealers than the makers. The most striking feature of the last sixty years has therefore been the rapid growth of the employment of women in commercial houses, including shops.

During the war a remarkable change in the work done by women took place; the large number occupied in munition-making, clerical work, and the transport services were drawn partly from domestic service and partly from those who had been engaged in home duties.

FEMALES,* EARNINGS OF. The history of women's wages from the Wage Census of 1906 to the present time must be divided into two periods, the one lasting up to July 1914, the other covering the war and early post-war conditions.

During the first period no striking changes in the amount of women's wages took place; the absence of any body of statistical evidence makes exact comparison impossible. On the one hand there was a gradual rise in prices, which depressed real wages; on the other, private and public enquiries had directed attention to the extremely insufficient wages often earned by women, and to their harmful effects both on individuals and on society. The women themselves through their organisations and enlightened public opinion worked hard to remedy the evil and met with some success. Legal minimum rates were fixed under the Trade Boards Act of 1909 for the workers in men's ready-made tailoring, lace-finishing, paper-box-making, and hand-hammered chain-making, to which were added just before the war shirt-making, food-preserving, and sugar-confectionery, tin-box-making, and wrought hollow-ware, and linen and cotton (hand) embroidery. In July 1914 the legal minimum for women over 18 varied in the four first-named trades from 2¾d. to 3¼d. an hour, or about 12s. to 13s. 6d. for the normal working week, with lower rates for learners. A higher standard was set by the Women's Co-operative Guild, who succeeded in getting a minimum wage of 17s. a week adopted for the adult women employed by Co-operative Societies. Wages were rising too in domestic service, in which, owing to its unpopularity, demand was always in excess of supply. Efforts were also made to increase the earning power of women and girls by improving the quality of their work through technical classes; the Day Trade Schools for girls organised by the London County Council in dressmaking, tailoring, corset-making, millinery, upholstery, photography, and other occupations were the most striking examples of this policy. These changes influenced other trades and the general standard of women's work, and with it its rate of remuneration was slowly rising.

The result of the war (1914-1918) was to extend and accelerate all these movements; the changed value of money makes comparison with pre-war rates precarious. The enormous demand during the war for labour of all kinds and the women's ready and devoted response gave them a new status in the industrial world, which not only resulted in their enfranchisement, but made a return, when the pressure subsided, to the worst conditions of sweated labour impossible. The payment of men's rates in the munition trades to those women who were doing work recognised as men's before the war, intended to guarantee the men against undercutting by the lower-paid sex, broke down the established tradition of women's lower payment. Some women earned high wages on men's work during the war; the principle of "Equal Pay for Equal Work" found an increasing number of advocates and has received the lip-service of endorsement by Act of Parliament. By the end of the war the minimum rates for women on men's work had risen from the 20s. fixed in February 1916 to 35s., while women on women's work received 33s.; an increase of 5s. was granted to both in January 1919. On demobilisation the women were obliged to give up all men's work; it is therefore the rates for women's work which alone are of permanent importance. In an increasing number of trades minimum rates have been fixed either by Trade Boards or by agreements between employers and workers. In June 1919 the Agricultural Wages Board for England and Wales established the legal minimum rate of 6d. an hour for an 8 or 8½ hour day, with 7½d. an hour for overtime, and 9d. an hour on Sundays, and of 27s. per week of 54 hours in summer and 48 in winter for whole-time women workers; in Yorkshire, Cumberland, and Westmorland the three hourly rates were 7d., 9d., and 10½d. At the beginning of 1919 the legal minimum rates fixed by the Trade Boards, which in some cases included additional war wages, varied from 4½d. an hour in lace-finishing to 9d. an

[1] Home workers and about 61,000 women in the organised corps of women are excluded.

hour in shirt-making. In most of the needle trades, such as dress-making, tailoring, millinery, a minimum of 28s. for a 48-hour week was agreed upon, with a regularly rising scale for learners; in London tailoresses and assistants received a minimum of 37s. 6d., and fellers, 32s. The minimum rate in laundries was also fixed at 28s. What proportion of workers earned rates above the minimum it is impossible to say. Agreements between the Employers' Federations and the Trade Unions raised the rates above the pre-war standard by 110 per cent in cotton-weaving, by 104¾ per cent in the woollen and worsted trades, and by 54 per cent in the hosiery trade. In the boot and shoe trades women time-workers of 20 years and over were paid a minimum of 30s. for a 48-hour week, and piece-workers at least 25 minimum wage legislation, the legal minima are frequently altered, as the conditions alter; the Trade Unions and Employers' Associations are continuously occupied with revision of rates; wages fixed by open competition are most susceptible of all to changes in demand and supply.

For the current rates of wages, the publications marked * amongst the following suggested for further reference should be consulted. Reports of Board of Trade Enquiry into Earnings and Hours of Workpeople in 1906, Cd. 4545, 4844, 5086, 5196, 5460, 5814, 6053, 6556; Report of War Cabinet Committee on Women in Industry, 1919, Cmd. 135; *Annual Report on Changes in Wages and Hours of Labour* *; *Labour Gazette* *; Notices issued by the Trade Boards Department of the Ministry of Labour

STANDARD SCALE OF SALARIES FOR TEACHERS.—*Proposed by the Representative Standing Joint Committees presided over by Lord Burnham.*

A. *Teachers in Public Elementary Schools.*

England and Wales (except London) .	225 0	15 0	400 0	177 10	12 10	320 0
London	275 0	15 0	440 0	197 10	12 10	360 0

There are certain additions for special qualifications and responsibilities.

per cent more. In printing and book-binding, minimum wage-scales were agreed upon in many districts varying from 37s. per week of 48 hours in London to 28s. in the smaller country towns of the Eastern Counties.

It is important to remember that since the war and the rise in the cost of living made radical changes of wages necessary no stable wage-level has yet been reached. In some occupations, *e.g.* the woollen trade, wages rise and fall by an agreed sum, as the cost of living index changes; the same plan is proposed for the Civil Service; in the trades covered by and by the Agricultural Wages Board *; *Journal of Royal Statistical Society*, July 1919; *The Course of Women's Wages*, July 1921; *Women's Minimum Wages*. D. M. B.

FERRARA, FRANCESCO (1810-1900), born in Palermo, died in Venice. Italians consider him their best Economist of the 19th century.

Ferrara's works have been nearly all collected in four large volumes, published by the *Unione Tipografica editrice* of Turin, 1889-91. This publication, however, never had his consent, although he could not legally oppose it. To Ferrara is due the renewal of economic study in Italy. He

obtained this result by putting into the hands of Italian students translations of a collection of all the principal foreign writers on economics, and editing the *Biblioteca dell'Economista*, with historical and critical prefaces, constituting a complete treatise on economics. From Sicily, where he had been imprisoned in 1848, and soon after liberated by the successful revolution, he had been sent to Turin to offer the throne of Sicily to the second son of Charles Albert. He could not return to Sicily, where the Bourbons had re-established their government. He joined the staff of the *Risorgimento*, which paper was edited by CAVOUR. On the 16th of November 1849 he gave his inaugural speech at the university of Turin, where he taught till 1859. This speech proclaimed him then and there as an economist superior to any other Italian economist ever since the times of GALIANI, GENOVESI, VERRI, GIOJA, etc., and superior to SCIALOJA, his predecessor in the chair of Turin, and to Pellegrino ROSSI, who had been teaching at the Institute in Paris and had just been murdered in Rome. In the ten years during which he occupied the chair of political economy in Turin his time was exclusively taken up by scientific work, and we owe to this period his writings on the theory of value, in which many of the most recent views are anticipated, on material and immaterial products, in which this problem, so difficult to many writers, seems definitely settled, on net and gross produce, on wages, on economic crises, on money, on free trade and protection, on banks and banking, etc. Into this period fall also his historical and critical explanations of the doctrines of the MERCANTILE SCHOOL, the PHYSIOCRATS, A. SMITH, of Smith's successors, RICARDO, MALTHUS, SAY, etc. Ferrara's lectures were collected on two occasions by students of his, in 1856-57, and 1857-58, but in a very inadequate way. In 1859 he had to resign, accused of having offended against the laws of the State in his lectures. He was offered a chair at Bologna and at Pisa, and preferred going to Pisa. From here, however, he was soon called to Sicily, occupied by the Italians in 1860, and he there took charge of a branch of the financial administration. Soon afterwards he entered parliament. He prepared the bill for the grist-tax (see MACINATO), the bill for the general tax on all income not already taxed by the land tax and the tax on houses—*imposta di ricchezza mobile*—spoke and wrote on inconvertible paper money, on banks of issue, was minister of finance for a short time, and retired in 1875 from active politics to Venice, taking the directorship of the first Superior School of Commerce founded in Italy. There he returned to science and to teaching, remaining a deputy till 1880, when he was made a senator. The Superior School of Commerce in Venice, besides forming merchants, has sections whose purpose it is to train future consuls, teachers of political economy, and accountants. Through these sections a large number of scholars of Ferrara are disseminated in the several branches of public administration, or are managing directors in commercial concerns. Ferrara, as a teacher, had the same conspicuous quality that CAIRNES had — to make the most complex problems appear so clear and simple, by reducing them to a few fundamental forces, that his solutions of problems remained indelibly impressed in the minds of scholars, and his method of working became a mental habit with his pupils. In polemics he was most formidable through his masterly use of irony. He often had occasion to make use of this quality, and rarely avoided these occasions. As a strenuous free-trader and personal friend of COBDEN, the reviews and papers of the time are full of polemical articles. He also strongly opposed the teaching of the SOCIALISTS OF THE CHAIR, imported from Germany after the famous Congress of Eisenach in 1874. Some of the leading Italian economists, such as Lampertico, COSSA, Luzzatti, having shown sympathy with socialism of the chair, historicism, relativity of economic laws, etc. (see RELATIVITY, PRINCIPLE OF), and having founded in Milan an economic association, Ferrara created the Adam SMITH society in Florence, with Martello, Pareto, Peruzzi, MAGLIANI, and others, and wrote on that occasion, among other things, a pamphlet against Lampertico, a masterpiece of Italian literature, apart from its value as an economic memoir. His writings are too numerous to be quoted here. A good bibliography has been drawn up by Professor Bertolini and published in the *Giornale degli Economisti* for January 1895, pp. 45-58. Ferrara was then living, but the writer is not aware that anything important has been added to the list. M. P.

FINAL UTILITY.* The principles and methods embodied in Jevons's doctrine of "final utility," together with the considerations suggested in the article on POLITICAL ECONOMY AND PSYCHOLOGY (*q.v.*), have received far-reaching developments in recent years. Hence a movement has arisen, variously described as "psychological" or "marginalist," which aims at unifying and simplifying economic theory, and at the same time affiliating its laws more closely to the principles that regulate human conduct in general.

Jevons has shown that the demand in a market in which there are no reserved prices can be represented by a collective curve. The amount of the commodity in the market is measured on the abscissa, and the equilibrating price on the ordinate. The next step is to point out that in so far as the sellers have reserved prices they ought to be regarded as themselves entering the market, with potential demands, on the same footing as the purchasers. Their intention to retain such and such quantities of their stock at such and such prices (whether for their own use or because they speculate on the demands of future purchasers) constitute *de facto* demands, and should be entered on the collective demand curve; which, together with the register of the amount of the commodity, will determine the price, as before. It follows that the cross curves of demand and supply, so often employed by economists, are really no more than two sections of the true collective curve of demand, separated out from each other, and read, for

convenience, in reverse directions. This separation is irrelevant to the determination of the equilibrating price (as may easily be shown by experiment), though it enables us to read off the volume of the exchanges that will be necessary in order to bring about the equilibrium, on any given supposition as to initial holdings. These cross curves, then, as usually presented, confuse the methods by which the equilibrating price is arrived at with the conditions that determine what it is.

Passing on to the problems of production and distribution, we note that in an industrially advanced community production rests upon the co-operation of a number of heterogeneous factors, the supply of which may be controlled by a number of independent individuals or combinations; and since it is obvious that the value of a means of production must be derivative from the value of the product, we have, theoretically, to determine the principle on which the value of the product when realised will be distributed amongst the various factors which co-operated in its production. Practically the factors will generally be brought together by a series of speculative transactions based on estimates made in advance. But in any case the value of the several factors must be determined by consideration of their productive effectiveness at the margin, and their equivalence to each other in fractional substitutions. For although the nature of the productive service rendered by such factors as land, labour, and tools, for instance, is different in each case, and no main factor could be replaced in its entirety by any other, yet every manager is constantly engaged in considering alternatives and equivalences between fractional additions or subtractions of them at the margin. It is so that he determines the proportions in which to distribute his resources over the improving or extending of a site, the modification of existing buildings, the replacing of machinery, the strengthening or reduction of this or that grade of labour, superintendence to reduce the waste of raw material, or the seeking of new openings, or maintenance of old ones, by advertisement. And all the time he has to convince his employers that his own skill in judging of these matters is as effectively productive as any increments in the more immediate factors of production that they could command for the salary that they pay him. The purchasers, then, in the great markets of the productive factors consider them under the uniform aspect of their relative productive efficiency at the margin, just as the purchaser in the retail market considers his heterogeneous purchases under the uniform aspect of their relative efficiency at the margin, in gratifying his desires or expressing his impulses. In a word, there are not many laws of distribution but one, and that law is the law of the market.[1]

Thus it will be seen that the end dominates the means throughout. The direction and administration of all resources is ultimately determined by estimates of the value of some experience, or by the imperativeness of some expression of the human consciousness. If at any point the expectations based on these estimates should fail or wither, the breadth of the stream that has already flowed at their bidding is powerless to sustain their living significance. Anticipated value determines the cost and sacrifice that will be incurred in production, but the cost and sacrifice, when once incurred, cannot control the value of the product.

If we now return to our starting-point in Jevons's "final utility" and its control of the distribution of a man's pecuniary resources, we note that the term "final" has been generally abandoned. It seems to imply a succession of experiences, following each other in time, as when a man's hunger is gradually appeased and each morsel meets a decreasingly urgent need. It is therefore inapplicable, for instance, to the problems we have discussed under the head of "distribution," where the units of the same factor may be indistinguishable in quality and may all be running abreast of each other in the output of a continuous stream of efficiency, but where nevertheless the withdrawal from co-operation of one unit out of five would be a less serious matter than the withdrawal of one out of four, because it would create a less serious disturbance of the proportions between the factors and would require less serious readjustments or additions to compensate it. The term "marginal" has been very generally adopted, but it has the disadvantage of still suggesting (especially in connection with land) some intrinsic differentiat-

[1] Thus "interest" is the price, reckoned in deferred payments, of present command of resources. The industrial, who expects this command actually to produce the future resources out of which he will make the payment, enters a market in which he will have to compete with the non-industrial who is willing to risk or compromise his future at the dictate of his present desires, and the ordinary consumer who, having a small revenue and no accumulations, is willing to pay a higher price for a possession, if he may spread the payment over a longer period, rather than cut deep into the quick of his other requirements at the moment.

"Rent" is a form of hire, the continuous purchase of a continuous revenue of services or enjoyments. The well-known figure of the rent curve, which represents the decreasing productive efficiency of successive applications of labour and capital to a fixed unit of land, is seen to owe its form not to any special characteristic of land but to the selection of a single factor of production which is not to increase while all the others do. The identical facts which such a curve represents, if read in the reverse order, would represent the same series of hypotheses as to the relative proportions of the several factors; but the rent would now be presented as a rectangular area, with its altitude determined by the alternative uses of land, and the return to labour and capital, as a curvilinear "residue," determined by the decreasing yield of a fixed constant of labour, etc., when spread over more and more land.

ing characteristic which earmarks and individualises a unit as "marginal" in virtue of its own nature. The term "fractional" may often be conveniently used.

Again, the word "utility" so conspicuously fails to include all the objects of wise or foolish, good or bad desire, to which the economic machinery ministers, that if it still sometimes retains its place (subject to careful explanation that it does not really *mean* utility) it is only for want of general agreement as to a substitute. The anomaly becomes more glaring and extends to the term "consumption," when we realise that the laws of political economy are but the application to a special set of problems of the universal laws of the distribution and administration of resources in general (whether of money, time, influence, powers of thought, or aught else) amongst all the objects that we deliberately pursue or to which we are spontaneously impelled, whether material or spiritual, private or social, wise or foolish. It is intolerable that "consumption" (with its subtle suggestion of a regrettable necessity that puts a drag upon the progress of "production") should continue to stand for the whole stream of "actualisings," in conscious experience, of the potentialities to the development of which human effort is devoted. It is the nature of these actualisings, contemplated or realised, that is the supremely significant thing in the life of a man or a community; for it is from them that all which leads up to them derives its worth or its worthlessness.

The psychological and philosophical bases and the historical evolution of the movement now characterised are exhaustively treated, with full bibliographical details, by Roche-Agussol in *La Psychologie économique chez les Anglo-Américains*, Montpellier and Paris, 1918, and the supplementary *Étude bibliographique des sources de la psychologie économique*, etc., 1919. P. H. W.

FINANCES.*

France. I. The annual Finance Act (*loi portant fixation du budget général de l'exercice*) consists of (1) a detailed table of expenses authorised, indicating the objects of expenses and the maximum to be spent (*crédits*), and (2) a table of taxes to be collected (enumerating precisely the taxes authorised and estimating their yield), and other sources of receipts such as those from state property and enterprises. The Finance Act contains a number of sections (*articles*), some of which expressly approve the tables in the budget, while others contain the provisions necessary for carrying out the budget—authority to raise temporary loans, changes in the law of taxes and tax practice, etc.

The Finance Act often includes measures which have no financial character (*adjonctions budgétaires*). This tacking is forbidden by the law of 30th July 1913, and by Standing Order 102 (2) of the Chamber of Deputies, but is not strictly observed by the Chamber. The Senate is more severe and readily deletes such proposals.

II. The Constituent Assembly and the Constitutions of 1791 and 1793 laid down the main principles of modern budgetary law: annual vote of taxation, annual vote of all public expenses. These principles were reaffirmed by the Constitutions of Year III. and Year VIII., but thanks to internal troubles, foreign war, and the despotism of Bonaparte, it was not till 1814 that they were put into practice. After the Restoration budgetary principles were applied, and developed under the ministries of Baron Louis and M. de Villèle. Public accounting was regulated by important provisions in 1838 and 1862. The *Décret* of the 31st May 1862, with some amendments, is the law now in force.

III. The financial year begins on the 1st of January, and the budget ought to be voted before that date. In fact, it is not passed till later, and is often six months behind. To observe the requirement of previous parliamentary sanction, the Chambers grant votes on account and authorise taxation for a certain number of months (*douziémes*). These provisional authorities do not cover any new service. Once the budget is passed, the provisional authorisations are merged in it.

IV. If in the course of the year new expenditure is found necessary, the government is compelled to obtain the sanction of Parliament to a new law authorising the opening of additional credits (law of 14th December 1879). Ministers who anticipate this authority are by law personally responsible, but this responsibility has not been seriously enforced. The Finance Act of 30th April 1921 attempts to restore the control of Parliament in this respect by forbidding accountants on their personal responsibility to make any payment for which Parliament has not granted credits. A few rare exceptions are allowed by the same law.

V. Ministers are forbidden (1) to incur liabilities or make payments for purposes not specified in the budget; (2) to exceed the maximum fixed by Parliament; (3) to meet the expenses of one year out of the credits of another. On the 31st December credits not utilised are annulled. There is no expenditure on permanent credits. The system of charges on the Consolidated Fund has been sometimes proposed in France, but always rejected.

VI. The revenue can only be collected in France when specifically authorised by Parliament for the current year. Taxes are not, as in England and America, legalised until Parliament shall otherwise determine, but are imposed anew each year. All the public revenues are merged into one common fund, out

of which public expenses are met. To this rule, which dates back to 1789, there are a few unimportant exceptions.

VII. Since 1920 the budget consists of three sections: (1) the ordinary budget, including ordinary and permanent receipts and expenses; (2) the extraordinary budget; (3) the special budget, comprising receipts and expenses arising out of the Peace treaties, especially the sums recoverable from Germany for reconstruction of ravaged districts, war pensions, etc.

The extraordinary budget is an expedient which long experience has shown serves merely to result in meeting contentious expenditure by borrowing. It was in existence in the nineteenth century until 1890, when it was suppressed in the face of much difficulty, but was revived during the war. Its abolition is again demanded in many quarters.

There are in addition a number of special Treasury accounts, mostly created during the war, owing to the need for immediate expenses expected to be covered by receipts in the near future, chiefly for feeding the civil population: corn, sugar, petrol accounts, etc. The financial results of these operations have been deplorable, owing largely to bad management, and efforts have been made since 1920 to return to normal conditions. The budget ought, so far as possible, to include all the finance transactions of the year.

VIII. The constitutional law of 24th February 1875 required the budget to be presented first to the Chamber of Deputies. It is not laid before the Senate until the Chamber has voted it. After interminable discussions since 1876, the Senate has established its right to modify the taxes voted by the Chamber and even to increase the credits granted by the Chamber, if the government so desires. The Chamber has the right to modify the government proposals as to revenue and expenditure, and may reduce or increase the credits demanded. The standing orders were amended in 1920 with a view to the limitation of this power of initiative, but the majority of the deputies are jealous of any restriction upon what they regard as the constitutional right of the Chamber in such matters. Others consider some such limitation indispensable to the balancing of the budget, which has proved so difficult since the war.

IX. The passing of the budget through each Chamber is very complicated. First comes a minute examination by the Finance Committee. In each Chamber the Committee is selected by proportional representation of each group. It assumes wide powers of revision of the government proposals, and examines policy as well as details of finance. It claims the power to reject the whole proposals for taxation and to change completely the programme of expenditure, and to substitute its own ideas. In practice the Chambers discuss, not the government proposals, but the plans of the Finance Committees. The responsibility of government for budgets and taxation is thus somewhat weak.

Next comes discussion in public sittings of the full Chambers. No limit is imposed on speeches or on the number of sittings devoted to the budget. The debates are long and confused, and members refrain by courtesy from compelling a closure of debate, even though the discussion is really exhausted. Before the war the Senate dealt with the budget fairly promptly, but now it takes its time and has increased its vigilance since the Chamber leans more than ever to exaggerated expenditure.

This explains the delay in passing the budget. The discussion begins with the reassembling of the Chambers in November, but the New Year arrives with the budget still not voted. Proposals to change the beginning of the financial year to the 1st of April or July have often been made. In 1920 government proposed the 1st of April, but nothing has come of its plan.

X. The execution of the budget is governed by three great principles:

1. The accounting period is the *exercice*. Payments and receipts are entered in the accounts according, not to the date on which they were made or encashed, but to the budget in which they were authorised, unless the date of receipt is after the 30th April, in which case, if belonging to a previous budget, they are entered under a special heading, "expenses or receipts of a closed exercice." This system, complicated as it is, has been slightly modified by the laws of 1889 and 1899 so as to approximate more nearly to the British system. But the old practice is dear to the Ministry of Finance, which pretends that it allows of comparing results with estimates. It is in reality a method of withdrawing expenses from parliamentary control.

2. Every payment is made by an order (*ordonnance*). There must be a credit in the budget, and a minister or his delegate after proof that the service has been rendered, and that the payment is due, gives an accountant the order to pay. This order (*ordonnance de paiement*) is carried out by the accountant after he has verified its propriety and regularity. He is personally and pecuniarily responsible for making a payment which is out of order. In that case he pays only on the order of the Minister of Finance, who has thus the power to order payments which are irregular and for which there are no credits. This abuse has been so frequent since the war that the law of 30th April 1921 forbids accountants to pay under these conditions.

To prevent commitments without credits or beyond the limit of credits authorised, there has been, since 1890, in each Ministry a Treasury representative: *le contrôleur des dépenses en-*

gagées. His position has been gradually strengthened, and in case of any proposal for irregular expenditure he must not only refuse his *visa* but report the matter to the Minister of Finance, who has, however, a much weaker position in France than in England. Attempts to give him a preponderating power in such matters have been strongly resisted.

3. The functions of *ordonnateur* and accountant (*payeur*) are separated to admit of control of the first by the second.

4. All receipts are encashed by the agents of the Minister of Finance.

XI. The periodical publicity of finance is assured by the insertion in the *Journal Officiel* every month of two accounts, one of receipts and one of payments. This last is barely intelligible to the public and is of little enlightenment to specialists. The law of 30th April 1921 orders the financial results in receipts and expenses to be published quarterly, starting with 1922. Up to date it has been impossible to persuade government to issue a summary weekly statement.

XII. When the *exercice* is closed, about the middle of the second year after the beginning of the budget, each ministry draws up the account of the expenses it has incurred. The Ministry of Finance collects these accounts together, adds its own account of expenditure and the account of receipts. The ministry further adds a general table in detail of receipts and expenses.

This *Compte général* is the basis of audit by the *Cour des Comptes.* This court, composed of irremovable judges of the same status as the judges of the highest Court of Cassation, examines all the documents embraced by the accounts. It does not examine the accountants or officials concerned in administration. It issues decrees upon each account, compares the results of the accountant officers' operations with the account of the ministry, and makes declarations of conformity. Finally, it draws up an annual report to the President of the Republic, in which it enumerates the principal irregularities it has discovered, and proposes the accounting reforms which it thinks desirable. The ministers are required to reply to the criticism of the court, whose observations and the replies are printed, and the whole is then presented to Parliament.

In each chamber an Accounts Committee is set up to examine the bill presented by government, placing on record the results of the *exercice.* When the Committees have reported, the Chambers vote the law (*loi de règlement*) settling the *exercice.*

This system of audit is very imperfect. The *Cour* is snowed under by the documents which it is legally required to examine one by one. As it does not examine witnesses, it has to request explanations by letter and await replies, which are often not forthcoming. The *Cour* is badly organised. There is competition for the lower posts, but those who succeed hardly ever rise to the higher positions. Political favour has more weight in promotion than zeal or ability.

The control of the parliamentary committees is more effective, but these committees have not at their disposition the staff nor the documents which are necessary. They are not aided by members of the *Cour* nor by representatives of the Ministry of Finance. Nevertheless, thanks to the activity of certain members, good work is done.

A commission was appointed in 1917 with a view to reform of the system of audit, but it has not met since 1918, and no further steps have been taken.

XIII. The public debt has no separate administration. All loans must, in theory, be authorised in advance by Parliament; but since 1915 the government has assumed the right to issue without such authority short loans (Treasury Bonds and National Defence Bonds with less than one year's currency) and even foreign loans. This irregular procedure has contributed to increase the financial disorder, but Parliament shows an inclination to insist upon a return to the regular practice.

XIV. The system of taxation is characterised by the following features:

1. A traditional preponderance of indirect taxation, which has been aggravated by the law of 25th June 1920. This law imposed very heavy charges upon consumption. The tax of 1·10 per cent upon all sales has been very unsuccessful, both in its yield to the Treasury and in its effect upon trade and the public. The present system in France seems to resemble that of England after the Napoleonic War—taxation of everything imaginable.

2. A frankly protectionist customs tariff—aggravated since the war.

3. Fiscal privileges granted to the agricultural classes. Agricultural profits, though very high, are only lightly taxed. Holders of treasury scrip are allowed to escape the ordinary tax on income from personal property in respect of such securities, but not the tax on total revenue.

4. Direct taxation has been remodelled in 1914 by a progressive tax on total income, and in 1917 by a tax on income under different schedules (land, houses, movable capital, salaries, industrial and commercial profits, etc.). This last tax is progressive, and varies with the source of income. There is much evasion owing to the disorganisation of administration brought about by the war.

5. Taxation on successions and donations was revised in 1920, but is largely evaded.

At the end of 1920 expenditure greatly exceeds revenue.

Before the war the public expenditure of the state approximated to 5200 million francs, having grown steadily year by year. The progressive increase of sums appropriated under finance legislation (in millions of francs) was as follows:

Year.	Amount.
1904	3565
1910	4185
1911	4386
1912	4497
1913	4738
1914	5191

During the war the sums appropriated were as follows:

Year.	Amount.
1914 (August 1 to December 31)	6,589
1915	22,804
1916	32,945
1917	41,679
1918	54,537

Since the war ended, the expenditure has only decreased slightly. For 1919, 49,029 millions of francs were voted in appropriations. For 1920, the appropriation was 52,064 millions of francs. The expenses for the first six months of 1921 have been 21 milliards. The budget of 1922 is as follows:

	Million francs.
Ordinary budget	23,180
Extraordinary budget	1,752
	24,932

In these appropriations no account is taken of the expenditure for repairing the damages of war, which outlay the treaty of Versailles charges against Germany and which make up a *special budget*. The appropriations voted in 1920 for that special budget total 20,566 million francs. As Germany has not yet paid over anything, this means that France faced a public expenditure in 1920 of about 52 milliards of francs (with the reservation that Germany will have to make repayments). These figures are certainly less than the real sum, for there have been in 1920 supplementary appropriations for more than 2776 million francs.

From 1st August 1914 to 30th June 1921 the appropriations have totalled 280,658 million francs. With an annual peace budget of 5500 million francs, six years of peace expenditure would total 33 billion francs. The costs of the war may thus be calculated as about 240 billion francs—that is, the literal expenses borne by the state.

Among these expenditures there are some the progressive growth of which is astounding. Such is the interest on the public debt. The increase was as follows (in millions of francs):

Year.	Amount.
1914 (5 months)	59
1915	1899
1916	3333
1917	4863
1918	7087
1919	7986
1920	11,681
1921 (estimated)	12,526

Germany*

The German Budget

I. The Estimates, Preparation, and Presentation

In Germany, budgets are framed annually for the empire, for the states, and for smaller local governments. Some of these budgets are dependent upon each other. In order to compare German budget figures with those of other countries, it is necessary to add the items of the revenue and expenditure of the several states and of the federal budget. Many expenses paid elsewhere by the central administration, such as justice, schools, police, are paid in Germany by the states.

The German federal budget (*Reichshaushaltsplan*) has, like that of France and Belgium, the form of a law. Until the revolution of 1918 the budget law, like every law, required the consent of the Bundesrat and Reichstag, and had then to be signed and published by the Kaiser. Since the new federal constitution of August 11, 1919, the Reichstag alone has to vote all laws. The *Reichspräsident* is obliged to sign and to publish the budget. As formerly, only a short extract of the budget voted by the Reichstag is published as law.

The estimates for the budget year, which begins April 1 and ends March 31, are prepared early in the preceding winter by the government, and the federal minister of finance

—after having found the support of the cabinet—at first presents the estimates to the *Reichsrat*, in which the governments of the states are represented. The *Reichsrat* is entitled to pass the budget proposals with or without amendment. Generally, after Christmas, the minister of finance presents the budget estimates to the *Reichstag*, and communicates the amendments of the *Reichsrat*, with the cabinet comments upon them.

A special law on the details of the preparation, presentation, and voting of the estimates, and on the execution of the budget, exists in Prussia, but not as yet for the empire. Some articles of the constitution and the standing orders of the *Reichstag* alone govern the procedure. All revenue and expenditure of the empire must be estimated for every year and be brought into the budget law. This principle of *Bruttobudget*, which was also adopted by the old constitution, is in practice not perfectly realised. Only the surplus, not the whole revenue and expenditure, is stated for the *Reichsdarlehnskassen*, and for the industrial and commercial concerns in which the empire is interested.

II. The Budget in Parliament

Article 85 of the constitution prescribes that the budget must be fixed by law before the budget year begins. For several reasons since 1919 delay of the budget has occurred. The estimates were in due course presented by government. But slow procedure in parliament, difficulties arising from paper inflation and inevitable supplementary votes, and finally difficulties connected with the reparations in consequence of the treaty of Versailles, had this effect, that the budget could not be settled in proper time and was subjected to frequent subsequent change.

If there is any disagreement as to the estimates between the government and the *Reichsrat*, the *Reichstag* ultimately decides by a majority. But if the *Reichstag* changes the estimates by increasing expenditure or by voting expenditure not proposed by government, the *Reichsrat* has a veto. If then no arrangement between the *Reichstag* and the *Reichsrat* can be achieved, ultimately the *Reichspräsident* may order a referendum on the budget.

In case of serious difference as to budget items between the government and *Reichstag*, it would be necessary for the cabinet to resign. The *Reichskanzler* and the federal ministers must have the confidence of the *Reichstag*, as Article 54 of the new constitution expressly provides.

Since the revolution, parliamentary government has been introduced in imitation of the system of western Europe. But the essentials on which parliamentary government depends in England were not all adopted in Germany. Firstly, members of the government, without being members of the *Reichstag* or of the *Reichsrat*, are entitled to speak in discussions of these houses at any time. This is not only a formal deviation from British constitutional principles. In Germany the leading member of the federal cabinet is not absolutely the leader of the majority in the parliament. As in France, so in Germany, parties are numerous and scattered. Coalitions of several parties must be formed to support the cabinet; the ministries must be distributed among the parties of the coalition. Such discipline and homogeneity as is found in the ministerial party in the United Kingdom is not possible; in the French as well as in the German system, there is no room for a responsible opposition which must be ready to take office after a defeat of the government. In Germany it is possible that the government is supported by a coalition of the parties of the centre, and is opposed by the extreme right and the extreme left parties, who are united in opposing, but never will be inclined to unite for constructive policy.

A further feature of former constitutional tradition may be observed in budget matters. Before 1918 the German *Reichstag* had no direct influence in the formation of the federal cabinet, and ministers in case of want of confidence of the *Reichstag* were not obliged to resign. In this older period an elastic federal income tax was not yet realised. Parliamentary influence was exercised more by the votes of supply than by the votes of ways and means. To-day the *Reichstag* has the absolute control not only of expenditure, but also of revenue, and a cabinet would be impossible which was distrusted by the majority of the *Reichstag*. But secondary effects of the former constitutional order may still be observed. The new constitution takes precautions only against increasing the items of expenditure by the *Reichstag*, not against demagogic alterations of tax laws proposed by the government. Progressive scales may be rendered more severe by the *Reichstag* the plan of a forced loan, not proposed by government, may be thrust by parliament upon a weak executive, etc. Article 85 of the new constitution provides that expenditure regularly is to be voted only for one year, whilst such a precaution is not provided for revenue. Practically since the end of the war, financial pressure has obliged government to demand new taxes continually from the *Reichstag*.

Moreover, some provisions are taken in order to prevent over-hasty revenue laws being carried by a majority of the *Reichstag* which is not controlled by a strong government. All legislation proposed by government must first be presented to the vote of the *Reichsrat*. But the *Reichswirtschaftsrat*, a non-political body of experts, must also be consulted before new taxes are proposed to the *Reichstag*. If the

Reichsrat does not agree to a tax proposed by the government, the amendments recommended by the *Reichsrat* must be communicated by government to the *Reichstag*. In the future the *Reichstag* will be led by experience to take precautions by the standing orders against over-hasty votes and amendments of laws on taxes. In the meantime, Article 74 of the new constitution undertakes to prevent too hasty legislation on taxes by introducing a suspensive veto of the *Reichsrat* against votes of the *Reichstag* on taxes. Ultimately a referendum ordered by the *Reichspräsident* may decide. If no referendum is ordered by the *Reichspräsident*, the *Reichstag* may definitely carry a law on taxes against the vote of the *Reichsrat* with a majority of two-thirds. It may be very difficult for a German government under financial pressure to renounce money offered by an imprudent tax bill of the *Reichstag*.

British experience that "tacking of money bills" is not without dangers, has influenced Article 85 of the new German constitution, by which it is forbidden to insert into the budget bill dispositions which will have effect beyond the budget year, or which are not connected with revenue or expenditure.

Very virtuous provisions are contained in two articles of the new constitution which have not yet been much followed in practice in consequence of the very difficult financial position. Revenue by credit ought to be taken only for profitable purposes (Article 87); a survey of the real expenditure and revenue of the past year must be laid in the following year before the *Reichsrat* and *Reichstag* for discharging the federal government.

But in consequence of the enormous payments due for reparations and the rising and changing value of the gold mark in which the payments are to be made, it has up to now been inevitable to increase incessantly the floating debt to be discounted at the Reichsbank. Credit has been taken to the amount of many milliards of paper marks for other than profitable purposes.

On the other hand, there are two causes of delay in the budget business of the *Reichstag* and in the final accounts of revenue and expenditure which are founded on historical traditions and might at once be reformed.

1. The estimates of the federal budget are discussed not only three times by the whole house of the *Reichstag*, but also in a small budget committee. It is usual to discuss all complaints of the *Reichstag* during the budget debate, although other and earlier opportunities existed, and the closure of the debates is not settled in advance as in England, so that the budget debate is much protracted.

2. Like France, Germany has conserved the system of the *budget d'exercice*. It has not, like England, the *budget de gestion*. The definite accounts cannot be produced very early under a system which compares every item of revenue and expenditure with the estimates of a budget year which may have been already past. When the accounts are definitely closed and comptrolled by the Audit office (*Rechnungshof*), they are laid before the *Reichstag*, usually very late.

Since the payments of the empire are centralised at the Reichsbank, it is to be assumed that a reform bringing a quicker closing of accounts would not be impossible and would be important.

III. The Formal Structure of the German Federal Budget

The German federal budget to-day consists of three independent parts, which receive large sums one from another and contribute one to another. There are now three budgets:

1. General federal budget. 2. Budgets of the federal enterprises: post and telegraphs, government printing office, railways. 3. Charges in consequence of the treaty of Versailles. Each of these parts is divided into an ordinary and an extraordinary budget. The expenditure of the ordinary budget is again divided into recurrent and non-recurrent expenditure. The term "non-recurrent expenditure of the ordinary budget" is not quite logical. It has its origin in pre-war experience. Some expenditure had formerly been regarded as non-recurrent and was met by borrowing, but after a short time similar expenditure reappeared in the budget. So it was proposed to meet such cases by increased taxation. To-day the term "non-recurrent expenditure of the ordinary budget" is only a euphemism for recurrent expenditure, and practically the same.

A fatal consequence of the division of the federal German budget into three parts is that it is nearly impossible to-day to calculate what the total net amount of the federal expenditure is, since many items appear more than once in different parts of the budget. A mechanical addition of the expenditure of the three budgets would give much too great a sum.

It would be an improvement if a general abridged net budget were added to the three budgets of gross revenue and expenditure.

As in France, so in Germany, specialisation in the budget goes very far, and generally there is not much chance for *virements*. But of late a great delay of the definite budget was not to be avoided, and in practice it was necessary to administer finance by votes on account. In these the specialisation is not very minute, so that practically the result was the same as if large possibilities of *virements* had existed.

W. L.

The Netherlands.*—The finances of the Netherlands are since 1907, if not legally, yet actually, divided into two parts: (*a*) the ordinary

expenditure and revenue, (*b*) the capital expenditure and revenue. The latter expenditure is conscientiously restricted to remunerative public works and interest-bearing advances. Moreover, since 1907 there have been only four years in which the capital expenses were not, be it for a small part, covered by a surplus of the ordinary returns.

As it became apparent soon after the beginning of the great war that there would be for some time a good deal of temporary expenditure —for maintaining neutrality, for meeting the need of food of the population, etc.—that could neither be paid at once from taxes nor be reckoned as capital expenditure, a third heading was opened for this particular kind of expense and the means to cover it. The total amount of the so-called war crisis expenses up to the end of 1919 was £162,458,260, whereof £57,405,989 was paid out of the yields of extraordinary levies, £93,354,122 being covered by the yields of semi-compulsory loans (funded debt), and £11,634,895 by treasury bills.[1] Provisions have been made from the beginning in order that the compulsory loans may be redeemed in forty years at the utmost. A fund has been created that is supplied by extraordinary taxes and additional percentages to ordinary taxes (see below), out of which interest and amortisation of the crisis loans are paid.

The normal ordinary expenses went up from £14,098,465 in 1905 to £20,215,446 in 1914, and £40,200,930 in 1919. In comparing the figures, allowance should be made for the decline of the purchasing power of money.

The expenditure in 1919 is divided as in the following table:

Civil List	£73,207
Parliament	123,657
Foreign Affairs	232,112
Justice	2,017,301
Home Office	425,192
Instruction	7,630,814
Marine	3,452,841
National Debt	4,583,889
Finance	3,476,438
War	3,969,500
"Waterstaat" (dikes, canals, roads, etc.)	2,729,373
Post, Telegraph and Telephone	4,772,326
Agriculture, Industry, and Commerce	4,236,614
Labour	2,003,192
Colonies	470,403
Unforeseen	4,071
Total	£40,200,930

The item Agriculture, Industry, and Commerce includes £3,466,400 for the working expenses of the state coal-mines.

The ordinary revenue for the year 1919 being £41,255,844 (as specified below), there is a surplus of £1,054,914.

[1] This floating debt has been funded by the compulsory loan issued in May 1920.

The capital expenditure of the year 1919 was £9,867,604, the capital returns £1,003,576, leaving a deficit of £8,864,028 to be covered by the surplus of the ordinary revenue and by loan.

The figures of the funded debt, apart from the debt for crisis expenditure (mentioned before and hereafter), are:

	Nominal Capital.	Interest.
1905 (end)	£95,396,454	£2,694,691
1919 (end)	89,523,833	2,469,598

The floating debt (apart from floating debt for crisis expenditure) was at end of 1919, £35,045,771. Adding the crisis debt at the end of 1919 to the figures of 1919, we have a total funded debt for the end of 1919 of £180,057,000, and a floating debt of £46,680,665, against a claim on the Netherlands Indies of £15,687,000 (unfunded, £10,000,000).

From 1905 until 1914 there were no interesting changes in the revenue system, but for the increase of the succession duties, then fixed at 1·5 to 2·5 per cent for descendants in the first degree of relationship, and at 4 to 20 per cent for more distant relatives and other heirs, the special duties on property consisting in bonds and stocks being abolished.

In 1914 a serious reform was introduced by replacing the existing "property tax" and the "tax on business profits and income from labour" by a general income tax, besides which the property tax revived with a much reduced rate in order to impose an extra charge on funded income (Prussian system).

The income tax was charged at first from all incomes from £54 upward (now from £66 upward); the rate of the tax was at first from 0·2 per cent at £54 to practically 4 per cent at £2750, and 5 per cent at £30,000 and upward. The rate was steeply increased in 1918, and is now from 0·125 per cent at £66 up to 5 per cent at £2000, and practically 15 per cent at £30,000 and upward.

The property tax, charged, as before, on all kinds of property, was levied from all fortunes from £1333 upward; the rate, fixed in 1914 at ½ per thousand, has been increased to 1 per thousand in 1918.

During the years 1916 and 1917—apart from the introduction of the crisis taxes specified below—a number of existing taxes were modernised and increased; among others the stamp duties, the registration duties, the beer excise, and the succession duties. These duties were extended to gifts between living persons and to acquisitions from life insurance policies, and the rate increased. It now varies from 1·5 to 6 per cent for descendants of the first degree and 4·5 to 24 per cent in other cases. Moreover, a small statistical duty was introduced on all exports and imports, and the tax

on dividends from companies, thus far incorporated in the income tax, was transferred to a special tax, which also applies to bonuses for managers and directors, etc. The rate of the company tax now is 5 per cent, with 33 additional per cent for the crisis fund.

The ordinary revenue for 1919 was derived from the following sources:

Land and Building Tax	£1,398,479
Personal Tax, *i.e.* housing tax, tax on furniture, tax on attendance, tax on motor-cars, etc.	1,393,066
Income Tax	5,357,961
Property Tax	804,412
Tax on Dividends and Bonuses	967,141
Excise—	
Sugar	3,035,505
Liquors	3,241,684
Meat	1,179,946
Beer	354,500
Wine	96,120
Salt	136,814
Import Duties	2,425,366
Stamps	1,703,272
Registration	3,300,536
Succession Duties	2,798,254
Domains	309,272
Railways	354,078
Post, Telegraph, Telephone	4,141,318
Netherlands Bank (part of profit)	933,171
Coal Mines	3,621,838
Interest	841,015
Other items	2,862,096
Total	£41,255,844

For covering the war-crisis expenses, from 1914 to 1919 a tax on war-profits, and from 1916 to 1918 Defence Taxes, being extra levies from property and income, were raised. The rate of the former tax was 30 per cent of the profits above the average profit of the years 1911-13, as far as it could not be proved that the extra-profit was not caused by the war. The total yield of this tax up to now is £51,560,698, of which £7,000,000 have been assigned to the municipalities. As to the Defence Taxes, the initial intention was to raise them only during the years 1916, 1917, and 1918. In 1919, however, they were prolonged with a substantially lower rate in order to meet the expenses of the fund for paying the interest and the amortisation of the crisis loans.

The revenues of that fund now consist of—

A. The Defence Taxes, I. *a* and *b* and II.

B. Additional percentage on the Income Tax (25), on the Property Tax (25), on the tax on Dividends and Bonuses (33), on the Personal Tax (20), on the Land Tax (20), on the stamp duties on foreign bonds and stocks (20), and on the excise duties on wine (20), liquors (10), and sugar (20).

The Defence Tax I. *a* is a tax on property of 0·05 per cent. The Defence Tax I. *b* is also a property tax, but with a rate rising from 0·03 per cent as the fortune is £4200 to 0·25 per cent on fortunes of £100,000, and 0·45 per cent on fortunes of £1,000,000. The Defence Tax II. is a supplementary tax on income rising from 0·166 per cent at £100 to 1·375 per cent at £2000, and practically 6 per cent at £30,000 and upwards.

As mentioned before, these taxes will automatically disappear as soon as all crisis loans are redeemed. A. van G.

FIRMS, PUBLIC REGISTER. See PARTNERSHIP; LIMITED PARTNERSHIPS ACT 1907, and STYLE OR TRADE NAME, in App. Vol. III.

FOOD SUPPLY OF THE UNITED KINGDOM. In the original article the dependence of the United Kingdom on oversea supplies of food, and the probable results of that dependence in time of war, were considered. What was then the subject of speculation is now a matter of history. The risks which the nation encountered in regard to its food supplies during the Great War differed from any which had been foreseen. The panic rise of prices at the outbreak of war did not occur, but on the other hand there was a sudden paralysis of the world's commerce. For a short period it appeared possible that the carrying trade of the world might stop by reason of the collapse of credit and the fear of unknown risks. The wise prevision and prompt action of the British Government warded off this danger, and the establishment on the first day of the war of the State war-risk insurance scheme set British shipping again in motion. The Grand Fleet kept watch from the beginning to the end of the war, and protected the trade routes of the world. Ships started confidently on their voyages from ports thousands of miles distant because the British Navy was on guard in the North Sea. It was not until the submarine got literally under its guard that the peril of interruption of our food supplies became imminent. The submarine menace after a few months was subdued, and shortly afterwards the war ended with the defeat of the German armies by the Allies. Whether if the war had continued the submarine attack might have again developed with irresistible force, or whether the rapid development of defensive measures would have been successful in affording sufficient protection to shipping, is now a matter of speculation and comes within the sphere of naval tactics and technique. The belief, however, is widespread, that the oversea food supplies of the United Kingdom would be, in any future war, even more insecure than they were in the past.

The home-produced proportions of the total supplies of those kinds of food which are normally produced in the United Kingdom have been calculated as follows:[1]

[1] *Food Supplies in Peace and War* (Longmans).

	Per cent.		Per cent.
Wheat and Flour	19	Cheese	20
Meat (inc. pig-meat)	60	Milk (inc. condensed)	95
Poultry	80	Fruit	30
Eggs	65	Vegetables	90
Butter (inc. margarine)	40		

In addition, a small proportion of the oats grown in this country was directly consumed as human food, while probably some 60 per cent of the barley crop was consumed in the form of beer. Generally, it may be estimated that at present approximately half the total amount of food of all kinds consumed in this country is home-grown.

The general effect of the war on the supplies of the principal articles of food is indicated in the following table, which shows the average annual imports during the five years prior to the war, in comparison with the average during the four war-years 1915-18, omitting 1914 as being only affected by the war during its latter half. The figures for 1919, being the first year after the Armistice, are added. The figures represent thousands of tons.

	British Empire.			Foreign Countries.			Total.		
	1909–13.	1915–18.	1919.	1909–13.	1915–18.	1919.	1909–13.	1915–18.	1919.
Wheat and Flour	2749	1689	1999	3156	3302	2460	5905	4991	4459
Beef	70	107	87	338	318	369	408	455	456
Mutton	173	116	146	92	49	68	265	165	214
Bacon and Hams	25	79	109	250	381	396	275	460	505
Cheese	96	105	101	22	27	5	118	132	106
Butter	47	41	39	161	77	39	208	118	78
Rice	141	305	14	100	104	28	241	409	101
Sugar	121	234	370	1693	1193	1234	1814	1427	1604

The interference with supplies of food during the war arose from three main causes:

1. The closing of the Black Sea.
2. The blockade of the Russian Baltic ports.
3. The shortage of shipping for commercial use.

During the early months of the war, raiders effected a certain amount of damage on the trade routes, but this was almost negligible. Indeed, the complete elimination in a very short time of all enemy vessels from the high seas was an unprecedented triumph of British sea-power. Even after the development of the submarine campaign, commerce on the high seas was not directly affected, and the risks to shipping from hostile attacks were practically confined to the narrow seas—the Mediterranean, the English and Irish Channels, the North Sea, and the Baltic. The vulnerability of the British Isles lay not only in the necessary convergence of ships at the end of the voyage when making for port, but also in the fact that a very large proportion of our food supplies normally came through the Dardanelles, the Straits of Gibraltar, and the Sound. Of the total supply of wheat and flour from all exporting countries before the war, more than one-fourth came from Russia. Fortunately, not more than about one-eighth of the supplies of the United Kingdom were derived from this source, the United States, Canada, Argentina, and India, each being on the average of greater importance to us. Apart from wheat, however, much of our supplies of other foodstuffs—bacon, butter, eggs, fruit—came from Europe, through or across the narrow seas, and were especially liable to enemy attack. For the first two years of the war, supplies from neutral countries—Denmark, Holland, and Norway in particular—were well maintained at the pre-war level, under agreements which were made with them for that purpose. Later, however, these agreements were abrogated, and during the last year of the war food supplies from these sources practically ceased.

This shutting-off of normal sources of supply inevitably caused a reduction of the available quantities, but there was on the whole a rapid response in other producing countries to the extra demand on their resources. It is quite possible that if means of ocean transport had been unaffected, the deficiency in the supplies from the nearer sources might have been, in a short time, fully made up from more distant sources. But the diminution of shipping became the dominant factor. The indiscriminate destruction of vessels—belligerent or neutral—from the early part of 1917 onwards led rapidly to a severe shortage of tonnage available for food and merchandise. It is to be remembered that the merchant shipping for civilian requirements was very heavily drawn upon by the demands of the armies, and when the United States entered the war these requirements were greatly increased for the transport of troops and stores across the Atlantic. The destruction of shipping by the submarines attained very menacing proportions. In the month of April 1917 no less than 875,000 tons of shipping were sunk, and in the course of that year the total losses of merchant vessels considerably exceeded 3,000,000 tons. During the whole of the war the destruction of merchant vessels of all descriptions and of various nationalities reached a gross total of 12,000,000 tons, or nearly one-

fourth of the world's shipping at the outbreak of war. The adoption at sea of a policy which violated all the usages and conventions which had previously mitigated the horrors of warfare among civilised nations happily failed in its object. The chief pressure fell upon the British Isles, and the difficulty of maintaining the transport for the armies as well as for the civil population compelled the adoption of measures to limit the consumption of certain kinds of food, and a system of rationing was adopted. It is significant, however, that breadstuffs were never rationed, and that even the normal check to consumption of a natural rise in price was not allowed to operate, the price of the loaf being artificially cheapened by a large subsidy from the Exchequer. Steps were taken to increase the production of cereals, with the view of reducing imports, the result being that the proportion of home-produced crops to the total supply was increased as follows:

	1910-14.	1915-19.
	Per cent.	Per cent.
Wheat	21·5	26·8
Barley	57·1	68·8
Oats	76·6	85·5
Beans	76·9	79·8
Peas	52·9	53·9

These calculations take into account the whole of the crops without distinguishing between that part which is actually consumed as human food and that which is used for seed or animal food. During the war, for a certain period, a much larger proportion of wheat went into the loaf, the percentage used at one time exceeding 80 per cent, the normal percentage being not more than 72. Considerable quantities of barley, oats, and beans, as well as of rice, maize, and potatoes, were also mixed with wheaten flour for bread-making, and the "war-loaf" was of a very heterogeneous description. These devices for economising wheat were adopted mainly to secure a greater use of home-grown cereals, and thus reduce the demands upon shipping. They also enabled the Government to increase the reserve of wheat in the country, and it may be recorded with satisfaction that the measures adopted early in 1917, when the campaign of "unrestricted" destruction of shipping began, resulted in an increase in the stock of wheat from 1,815,000 tons (about 3 months' supply) in January, to 3,290,000 tons in September of that year, notwithstanding a somewhat deficient harvest. In the following year the submarine attack had been effectively combatted; and although losses of shipping continued, on a much reduced scale, the menace of a serious interruption of oversea food supplies had practically disappeared. The loss of shipping, heavy as it was, had been to a large extent made good by energetic shipbuilding, not only in the United Kingdom—where the enormous demands of the Navy limited the output of shipping for commercial use—but in the United States, Japan, and other maritime countries. Even in the United Kingdom, however, no less than 1,348,000 tons of merchant shipping were launched during 1918, and by July 1919 the gross world's tonnage afloat was over 50,000,000 tons, or rather more than in July 1914.

During the earlier part of the war no direct action was taken by the State to increase the home production of food. Farmers were assisted to some extent in regard to labour and the supply of fertilisers, and they were not hampered by restrictions either in the management of their business or the sale of their produce. There was some extension of the area of arable land, and the acreage of cereal crops was fairly maintained, while the number of cattle and sheep was substantially increased. In the early part of 1917 the Government adopted a different policy, and from that time onwards farmers were subject to close supervision. Under the Defence of the Realm Act, powers were taken, and freely exercised, to compel occupiers of land to plough up grass land according to a schedule which allotted a definite quota to each county. At the same time a promise was made by the Government of a guarantee of minimum prices for wheat and oats, which was subsequently fulfilled by the Corn Production Act, which became law in August 1917. This Act also established the principle of a legal minimum wage for farm workers, and placed definitely on the statute book provisions which empowered the Government to intervene if owners or occupiers of agricultural land were not using their land to the best advantage for food production. The Corn Production Act was a temporary measure, expiring in 1922, but its main principles were embodied in the Agriculture Act 1920, which also included new provisions designed to protect the interests of tenant farmers.

In 1916 a Committee was appointed with the following reference:

> Having regard to the need of increased home-grown food supplies in the interests of national security, to consider and report upon the methods of effecting such increase.

The Committee was termed the "Agricultural Policy Sub-Committee," and was instructed to consider post-war conditions rather than immediate issues. It recommended the adoption of three main principles, all of which were new to British agricultural legislation, viz. the guarantee of minimum prices for wheat and oats, the establishment of a legal minimum wage for agricultural labourers, and the intervention of the State to prevent mismanagement

of estates and bad cultivation of farms. These proposals were avowedly made with the object of increasing the production of food, and, as already stated, were amplified and embodied in the Agriculture Act 1920. Whether that object will be achieved by this legislation is at present uncertain. The guarantee of prices has not prevented the reversion to grass of practically all the land compulsorily ploughed up during the war, and the area devoted to cereal crops is now substantially the same as before the war. It may be that the greater stability of conditions, and the provisions for the improvement of farming, will tend to increase home production, but it is very unlikely that any such increase will be commensurate with the increase of population, so that the position of the United Kingdom in regard to dependence on oversea food supplies will be in the long run unaffected.

FRENCH SCHOOL OF ECONOMISTS.* § 1. During the last thirty years, filled as they were with great events, economic doctrines in France have not undergone much transformation. The school remains faithful for the most part to the tradition of freedom. It has, however, suffered great losses in the persons of its leaders. Nearly all those whom we have cited as the most representative are no more. The obituary list is impressive: Courcelle-Seneuil and Baudrillart died in 1892, Léon Say in 1896, Frederic Passy and Maurice Block in 1901, Levasseur in 1911, Molinari (Belgian by origin, but a denizen of Paris for more than half a century) in 1912, de Foville in 1913, and the most celebrated of all, Paul Leroy-Beaulieu, in 1916. Before departing, however, they had still time to publish works which will preserve their memory. Mention may be made of Levasseur's revised and enlarged edition (4 vols. 1900-4) of his great *Histoire des classes ouvrières en France*, and his *Histoire du commerce de la France* (2 vols. 1911-12); Leroy-Beaulieu's *L'État moderne et ses fonctions* (1899), *La Question de la population* (1913), a matter more and more burning in France, and several new and revised editions of his well-known treatises on economics and finance.

Alone of his generation, still active and vigorous, M. Yves Guyot is to-day the standard-bearer of uncompromising free trade. He has succeeded M. de Molinari as editor of the *Journal des Économistes*, the oldest of all economic reviews. M. Liesse has succeeded to Leroy-Beaulieu as editor of *L'Économiste français*. In these two publications, and at the monthly meetings of the *Société d'Économie politique*, the combat is continued with its old vigour against socialism, protection, inflation, and state intervention in all its forms, multiplied so enormously during the war.

Since the deaths of the great protagonists the most noteworthy works of the liberal school are the *Cours d'économie politique* of M. Colson, a great treatise in six volumes, of which the publication began twenty years ago, and of which a new edition is now appearing.

This school is no more indulgent than in the past to heterodoxy, whether tinged with socialism or merely pursuing new methods. Neither the mathematical school—though its founder, Cournot, was a Frenchman, and Walras, another Frenchman, was one of its great masters—nor the psychologic or Austrian school, have taken root in France. Walras, as is well known, a voluntary exile, founded the Lausanne school. For this reason we did not include him in our previous list. He died at Lausanne in 1907, and has left hardly any disciples in France except M. Aupetit, author of a succinct work following the mathematical method, *Essai sur la théorie générale de la monnaie* (1901), and at present Secretaire-General of the Bank of France.

On the other hand, we must call attention to notable development in the historical school, of which in the last generation M. Levasseur was almost the only representative. To-day books on economic history are very numerous, and often excellent. We may name among others those of M. Hauser, who fills the newly-created chair of economic history and geography at the Sorbonne, *Ouvriers du temps passé* (1906); Mantoux (now one of the secretaries of the League of Nations), *La Révolution industrielle au 18me siècle (en Angleterre)*, 1906; Germain Martin (Professor at the Faculty of Law in Paris), *La Grande Industrie sous le règne de Louis XIV et de Louis XV*, 1899-1900; Weulersee, *Le Mouvement physiocratique*, two large volumes, 1910; and the collection of works on the history of labour, by various writers, under the direction of M. Georges Renard, Professor of the History of Labour at the Collège de France. Rather popular than scientific are numerous volumes by the Vicomte d'Avenel on the history of prices.

§ 2. We mentioned in our previous article as a new fact the advent of economic teaching in our universities (faculty of law). Its first representative, M. Cauwès, died in 1916. The last decades have seen great development in this direction, and a great crop of text-books

have sprung up, almost as many as there are universities. Original works have been more rare. Reference may be made to *Les Systèmes socialistes et l'évolution économique*, by Professor Bourguin (now deceased), 1904; *Traité de la science des finances*, par Jéze, 1910; *La Crise de la main d'œuvre agricole*, by Professor Souchon, 1916; *Les Crises périodiques de surproduction*, by Professor Aftalion, 1914; *L'Histoire des doctrines économiques*, by MM. Gide and Rist, 1909; *Les Finances de guerre de l'Allemagne*, by Professor Rist, 1920. The *Revue d'Économie politique*, edited by the present writer with the assistance of M. Rist, is the organ of the University economists, and welcomes the most diverse opinions. Pure theory finds little place in it—not from prejudice, but from lack of contributors.

§ 3. Socialism in France has lost its great chief, Jaurès. Though too prodigal of his eloquence in the Chamber of Deputies, meetings, national and international congresses of socialists, etc., to have time for much writing, his works deserve mention: *Études socialistes*, 1901-1903; *Histoire de la Révolution Française*, in which economic questions hold a large place. The tragic death of the great orator on the day war was declared will be remembered. He has not been replaced; and the few books to be noticed here are rather on the border-line of socialism. Georges Sorel, *Réflexions sur la violence*, 1908, has been epoch-making, notably by its thesis on the rôle of myth as a factor of revolutionary action. The author himself belongs to no socialist party, and has indeed since attached himself to the conservative side. M. Andler, Professor at the Sorbonne, has written numerous articles against Marxian and German socialism; M. Edgard Milhaud, now Professor at the University of Geneva, defender of state socialism, may be mentioned; *Les Fermiers-Généraux du Rail*, against the railway companies, 1920; and *La Marche au socialisme*, 1920. The militant socialists, even when they are learned like MM. Paul Boncour or Léon Blum, both of whom are deputies, are too absorbed by politics to write anything beyond newspaper articles.

Marxism has suffered severe discredit in France, partly because of its German origin, partly because it has brought forth Bolshevism. And by natural reaction we have seen a certain sympathetic return to the old French socialists, St. Simon, Fourier, and above all Proudhon. A new school of Proudhonists has just published a collection of tributes to Proudhon by ten young professors, *Proudhon et notre temps*, 1920. As for St. Simon, a new review has just appeared which has adopted the title of the old organ of the St. Simonians, *Le Producteur*, edited not by socialists but by craftsmen and men of business. Gratitude is felt to St. Simon and to Proudhon for having glorified the producer, and for predicting the coming of the industrial government which is to deliver us from the political and parliamentary government. This view is found again in a very curious study in two volumes by M. Maxime Leroy, *Le Coutume ouvrier*, 1913. The doctrine of syndical political organisation is still more strongly marked in a little book by a young engineer, M. Francq, which has just been published under the significant title, *Le Travail au pouvoir*, 1920. The movement is closely related to guild socialism.

In France, however, as in England, it is to be feared that this exaltation of production may result in the predominance of corporate or professional interest over the general interest, even though the title productive be applied not only to the manual labourer but be extended to the intellectual workers, who have newly founded a society with the somewhat lyrical name, *Les Compagnons de l'intelligence*. For this reason an association has been started (1921) to restore the balance. Its programme is to defend the interests of the consumer against those of the producer, by opposing to syndical socialism co-operative socialism, basing itself upon consumers' societies (called in England, wrongly, as we think, distributive).

§ 4. Between the two great schools of freedom and of socialism arises a large and growing group, which may be called reformist, though this label covers many diverse programmes.

Firstly come those who seek to satisfy the claims of labour, either by social legislation guaranteeing and laying down the rights of labour, or by agreement between capital and labour under the form of co-operative societies, profit-sharing, co-partnership, or collective bargaining. The literature on this subject is so abundant that it is equally difficult to make a complete list or to make a selection. We therefore limit ourselves to indicating the publications of the *Association pour la protection légale des travailleurs*, founded in 1920, an international society, of which the French section has published a hundred monographs on all points of interest in labour legislation. Secondly, we have the schools which bring all social questions back to a moral question, to be solved only by appeal to morality or even to religion. These reformers fight more particularly against the social vices—drunkenness and malthusianism. The specially Catholic school has produced very little since, at the beginning of the war, it lost its leader, Comte Albert de Mun, whose eloquence rivalled that of Jaurès. The *Ligue de la Jeune République* (which changed its name from *Le Sillon* in 1910) draws its inspiration from the Catholics, and has a very eloquent leader, M. Marc Sagnier. There is also a Protestant magazine, *Le Christia-*

nisme social, directed by pastors, but of small scope in action.

The school of Le Play (*q.v.*) has lost Claudio Jannet and Demolins, but continues its journal, *La Réforme sociale*. In this school may be included M. Paul Bureau, whose principal works, *La Crise morale des temps nouveaux*, 1907, and *L'Indiscipline des mœurs*, are filled with high moral principles. It is above all against the falling birth-rate and the causes of its diminution that he directs a passionate campaign.

The Great War has naturally thrown up a vast economic literature which cannot be grouped by schools. Among those who have been most read are: Victor Cambon, *Notre Avenir*; Lysis, *Vers la démocratie nouvelle*; Raphael Georges Lévy, *La Juste Paix*, in reply to Keynes. The distressing questions of high prices, inflation, war indemnity, restoration of the devastated regions, public debts, and taxation, have called forth many articles, but up to the present no substantial treatise.

In the first two decades of the century a great gap in our ignorance of foreign literature has been partly filled by translations from such authors as Cairnes, Ashley, Jevons, Marshall, Sidney Webb, Rodbertus, Schmoller, Böhm-Bawerk, Adolf Wagner, Clark, Irving Fisher, Loria, and others. C. G.

FRIENDLY SOCIETIES.* Two important events have happened since the last edition of this dictionary was prepared, and their effect upon friendly societies has to be considered. They are: the creation of a system of state insurance in 1911; and the great European war, which broke out in 1914. The following return shows for the three classes into which friendly societies are divided, and also for the whole of the bodies which are registered under the Friendly Societies Acts, the number of societies (and branches of affiliated orders) making returns, the aggregate number of their members and amount of funds, and the average amount of those funds per member, as returned to the registrar of friendly societies for the 31st December in the years 1911, 1914, and 1917. The differences between the first and second column may afford some indication of the effect on the voluntary friendly societies of the National Health Insurance Act; those between the second and third columns of the effect on those societies of the war. The fourth division of the table includes cattle insurance societies, benevolent societies, working men's clubs, and other societies which have been specially authorised for a variety of purposes, not being the assurance of sums at death or benefits in sickness, and therefore not so directly affected by the state insurance or the war as ordinary friendly societies are.

Societies under the Friendly Societies Acts.

On 31st December.	1911.	1914.	1917.
Affiliated Orders:			
Returns	21,042	21,161	20,525
Members	2,795,000	2,935,272	2,897,434
Funds	£29,123,000	£31,024,699	£32,557,873
Per Member	£10:8:4	£10:11:5	£11:4:9
Branchless Friendly Societies:			
Returns	6,189	4,782	4,231
Members	3,979,017	3,888,964	3,856,438
Funds	£22,735,568	£23,870,428	£27,407,919
Per Member	£5:14:3	£6:2:9	£7:14:1
Collecting Societies:			
Returns	64	55	60
Members	7,504,273	7,554,266	9,112,415
Funds	£10,269,911	£12,147,802	£14,139,225
Per Member	£1:7:4	£1:12:2	£1:11:0
All Societies:			
Returns	29,340	28,940	27,920
Members	14,940,103	15,189,960	16,690,345
Funds	£65,274,907	£70,109,341	£77,410,742
Per Member	£4:7:4	£4:12:4	£4:12:9

The amount of funds per member is no real test of the prosperity of a society, unless it is taken in consideration with the present value of the society's liabilities, which vary with the length of time that the member has been a contributor and with other matters. An example of this is shown by the figures relating to collecting societies, where in the second term of three years, although the funds increased from twelve to fourteen millions, the amount per member decreased from £1 : 12 : 2 to £1 : 11s., in consequence of the large increase in the number of members from 7,554,266 to 9,112,415. The amount contributed by the million and a half of new members during the three years may be estimated at £940,000, and if the whole of that were set aside to meet their claims, there would still remain £13,200,000 to meet the claims of the 7½ millions, or £1 : 15s. per member; that is to say, an increase of 2s. 10d. instead of a diminution of 1s. 2d. The same process would show a greatly increased amount per member if applied to all societies alike. Take, for example, the increase of 1,500,385 in the number of members; having contributed £910,700 in the three years, the remainder, £76,500,042, if shared among the other members, would give a quota of £5 : 0 : 9 per member instead of £4 : 12 : 9; that is to say, an increase per member of 8s. 5d. instead of one of 5d. only. The inference to be drawn in general terms from these returns is that neither the National Insurance Act nor the war has operated to arrest the progress of the voluntary friendly societies, either in respect of membership or funds or of the relation of one to the other.

Some points to be noted in the foregoing table are:

1. That the number of branchless friendly societies has diminished by 1908 in the six years.

2. That the amount of funds per member is nearly 60 per cent greater in the affiliated orders than in the branchless friendly societies.

3. That the increase in the amount of funds

per member during the six years was less than 8 per cent in the affiliated orders, and nearly 35 per cent in the branchless friendly societies. It would seem from this that some causes have been in operation to increase the means of the branchless friendly societies more rapidly in proportion than those of the affiliated orders, though the amount of their capital per member was much less at the starting-point, and they have therefore more leeway to make up.

4. That the collecting societies, which have for their principal object the assurance of sums payable at death, have been able to increase their funds, notwithstanding the increase in the claims upon them. The number of deaths in these societies was 126,952 in 1911; 131,119 in 1914; and increased to 181,994 in 1917. The payments upon death were £1,207,686 in 1911; £1,275,232 in 1914; and increased to £1,842,257 in 1917.

5. That as the latest returns are those for 31st December 1917, and the fatalities caused by the war continued after that date, there is no certainty that the increase in the funds shown by the table continued until the end of the war, but the probability is that it did. If we may take as a sample the published statements of a single society, the Ancient Order of Foresters, it appears that in that society alone, during the year 1919, the roll of members increased by 14,715 and the amount of funds by £318,866. The chief registrar, who points out in his report that the death-rate in the affiliated orders and branchless societies increased from 10·2 per thousand in 1910 to 15·6 in 1916 and 17·6 in 1917, suggests that this increase may have been met by a decrease in the claims for sick pay, owing to the number of members serving in the army, and that the sickness claims in respect of discharged and demobilised members will be more heavy in the years subsequent to 1917, so that the full effect of the war upon friendly societies cannot yet be measured. The views of the chief registrar are supported by the facts that in the branchless friendly societies, while the number of deaths increased from 39,550 in 1914 to 57,028 in 1917, and the payments upon death from £452,544 to £653,680, the payments in sickness diminished from £1,557,714 to £1,225,046—the increase of £201,136 in the one item being more than compensated by the decrease of £332,668 in the other.

The National Health Insurance Act requires every employed person to insure against certain benefits, including a benefit of 10s.[1] a week in sickness for men and 7s. 6d.[1] for women. As this is one of the benefits which had previously been insured through voluntary friendly societies, the act purports to withdraw from them so much of their business. The voluntary system, dependent upon each person's sense of the moral urgency of the insurance of sick pay, and of its practical utility, had been for more than a century developing sounder methods of working, especially requiring graduated contributions to meet varying risks, and repudiating any assistance from or reliance upon the general community, either by a state subsidy or a charitable donation. This act purports to substitute for it a system involving:

1. A flat rate of contribution from the employed.

2. An enforced contribution from the employer.

3. A subsidy from the state.

In these respects the act created an economic revolution. The legislature contemplated that, as an equivalent for these novel arrangements, the members of friendly societies would surrender their existing benefits, and that the surrender value would thus be released for other purposes. In this, as in some other of their expectations, they have been disappointed, for the members generally were not disposed to make this sacrifice.

The act allowed such friendly societies as should be "approved" by the Insurance Commissioners to act as agents for the state in the administration of the act and the distribution of benefits, and it contained elaborate provisions for their control; but we have it on the authority of Sir Alfred Watson, the able government actuary, who was formerly actuary to the Manchester Unity of Oddfellows, and as such was nominated a member of Lord Rothschild's Committee on Old Age Pensions, that in these matters the act was not intended to interfere with the voluntary business of the friendly societies, which they could continue to carry on under the same conditions as heretofore. Canon Davies, a Past Grand Master of the Manchester Unity, in his presidential address on 23rd September 1920 to the National Conference of Friendly Societies, said that he looked upon the independent side of their work as far the most important, and that he saw no reason why it should not largely develop, provided that the spirit which animated their forefathers remained with them. "The day which sees voluntary service die out spells the end of the societies. I am convinced, however, that there is no fear of this happening." There has, indeed, been one indirect result of the general acceptance by these bodies of the position of "approved societies." The consequent obligation of making elaborate returns and complying with a voluminous code of regulations has had a marked effect on the staffing of the societies. Some of those worthy men who had devoted themselves, for very inadequate remuneration, to the work of the societies, found themselves unequal to this additional burden, and resigned their offices. There has thus been gradually

[1] Since increased.

forming a new school of friendly society official, with greater technical training and (it is to be hoped) with better pay. In this respect, therefore, the educational value of friendly societies as a training for public usefulness has been once more demonstrated.

To sum up: the creation of a compulsory state insurance fund, administered by the approved societies, has served as an advertisement to those bodies, and may account for the increase of membership between 1911 and 1914. Economic pressure may account for some of the diminution since. All appearances indicate that the voluntary societies will hold their own. The fears of the pessimist, who thought that state insurance would destroy them, have proved to be unfounded. E. W. B.

AUTHORITIES.

Reports of Chief Registrar of Friendly Societies, 1911-1920. — *Oddfellows' Magazine*, 1920. — *Foresters' Miscellany*, 1920.—*Law of National Insurance*, by Sir Edmond Browne and Sir H. Kingsley Wood, M.P., 1912.

GEISSLER, DR. ADOLF (*c.* 1834-1902), was, like many other German economists, originally trained for another branch of study, having received a very thorough education in medicine. He also obtained a complete mastery of the mathematical theory of statistics. His earlier publications dealt with diseases of the eyesight. His most important economic work was on the mortality and duration of life among Saxon doctors, published in 1887. He became director of the Royal Saxon Bureau of Statistics, and published several medico-economic monographs on the influence of mortality on the birth-rate, etc. His chief works were :—

Die Verletzungen des Auges.—Monographsicht mit besonderer Rücksicht auf die Bedürfnisse des praktischen Artzes, etc., 1865.—*Die Farbenblindheit, ihre Prüfungsmethoden und ihre praktische Bedeutung*, 1882.—*Die Sterblickkeit und Lebensdauer der sächsischen Ärtze*, 1887.—[See *Economic Journal* for March 1902.] N. B. D.

GEORGE, HENRY (1839-1897), was the son of a Custom House clerk in Philadelphia, Pennsylvania. He left school when less than fourteen years of age. He went to sea as a foremast boy, but when seventeen returned and entered the printing trade. In 1858 he went to San Francisco, became first a miner, then a government inspector, and finally a journalist. He visited New York in 1868 to set up a telegraphic news bureau for a San Francisco newspaper. Failing in his endeavour he returned to the western city in 1869. But his stay in New York had opened his eyes to the poverty which accompanied increasing aggregate wealth, and two years after his return he wrote a pamphlet entitled *Our Land and Land Policy*. This did not create much impression, but it contains his leading idea. He then set to work to prepare for a more thorough study of the problem and more detailed exposition, and in 1877 the writing of *Progress and Poverty*, which appeared in 1879, was begun. This book attracted great attention, and the author soon found he had many disciples. It has since been translated into all the chief tongues of Europe.

Progress and Poverty is "an inquiry into the cause of industrial depressions and of increase of want with increase of wealth." The increase of productive power has "neither lessened the toil of those who most need respite, nor brought plenty to the poor." Poverty is deepest and the struggle for existence sharpest where "the conditions to which material progress everywhere tends are most fully realised." This fact proves that the social difficulties existing "do not arise from local circumstances, but are, in some way or other, engendered by progress itself." The reason for the growth of poverty "is that, with increase in productive power, rent tends to even greater increase, thus producing a constant tendency to the bringing down of wages." Rent and wages depend on the margin of cultivation, rent "rising as it falls, and falling as it rises"; wages "falling as it falls, and rising as it rises." The true remedy, then, is to make land common property. It is not necessary, however, to confiscate the land, "it is only necessary to confiscate rent." "What I propose as the simple yet sovereign remedy . . . is to appropriate rent by taxation," "to abolish all taxation save that upon land values." The entire rent, earned and unearned, should be confiscated. When improvements become indistinguishable from the land itself "the title to improvements becomes blended with the title to the land; the individual right is lost in the common right." All that justice or policy requires is the separation of "the value of the clearly distinguishable improvements made within a moderate period, from the value of the land, should they be destroyed." The danger of these opinions has become more apparent as time goes on.

In 1882 George wrote a pamphlet on *The Irish Land Question*, took the side of the Land Leaguers, and spoke for them. The remainder of his life was spent in propagating his philosophy by means of books, newspapers, agitation, and organisation. He made New York his headquarters, but made lecturing tours in America, England, and Australia. He was a candidate for mayor of New York in 1886 and 1897, but during the election campaign in the latter year he died suddenly of apoplexy. A biography has been written by his son. George's chief writings are—

Our Land and Land Policy, 1871.—*Progress and Poverty*, 1879.—*The (Irish) Land Question*, 1881.—*Social Problems*, 1883.—*Protection and Free Trade*, 1885.—*The Condition of Labour*, 1891.—*A Perplexed Philosopher*, 1892.—*The Science of Political Economy* (posthumous publication). An adverse criticism of the theory contained in *Progress and Poverty* appears in *Contemporary Socialism*, by Rae. J. H. J.

GERMAN SCHOOL OF POLITICAL ECONOMY.* Period IV. (1892-1921). In order to understand German economic thought, we must realise that the time since 1892 is one of transition in Germany's economic structure. Such periods are full of difficult problems. The ideas cannot be followed without a glance at the facts of the economic life of the time.

When Bismarck resigned in 1890, a new issue in Germany's economic policy had matured. It would not have been possible for any statesman to continue Bismarck's economic and social policy without change. On the other hand, political circumstances and public opinion were not yet ripe for a radical change.

It might be imagined that in a country with a parliamentary government and a two-party system a radical cabinet would in 1892 have introduced a free-trade policy and democratic principles in social and financial politics. But Germany was governed by a body of permanent officials. The cabinet was obliged to form a majority in a Parliament elected by universal suffrage, in order to get money for military expenses. Parties were numerous. The official view was that France was preparing a war of revenge, and that only a strong army would guarantee Germany from a French attack. But militarism was not popular among the radical parties. Only the coalition of agricultural and industrial protectionists, upon which Bismarck had relied since 1879, was inclined to vote for military expenses. The problem was to get the support of these protectionists in favour of a commercial policy which secured to an increasing population raw materials and food at tolerable prices and progress of business by increasing exports. Caprivi's argument was: Germany must export either commodities or people.

Bismarck had (1879-1890) avoided binding German protective duties by commercial treaties. His successor endeavoured to get foreign industrial import duties reduced or at least fixed. In exchange he was obliged to reduce German agricultural import duties. German industrial import duties in general were not reduced. It would have been fair to reduce them at the same time, but the countries with which treaties were concluded did not, with the exception of Switzerland and Belgium, demand it. Moreover, as from 1892 to 1895 corn prices went down in all countries, the cry was raised that agriculture had been sacrificed in the interest of industrial exports. A policy of compromise began, by which the government hoped to appease the agriculturists.

Bismarck's authority since 1879 had hammered into the classes, upon which his military policy relied, a neomercantilistic doctrine. The man in the street was persuaded that an unfavourable balance of trade would impoverish the country, that in foreign commerce profit could not be on both sides, that in negotiating commercial treaties the aim was, "qui trompe-t-on?" Such paradoxes of Bismarck were a dogma for self-taught politicians. If better theoretical arguments were brought forward, they were not appreciated. The scientific world had acknowledged that certain theories of Ricardo and Bastiat were no longer up to date. Some professors believed that a good deal of the old theory was sound and ought only to be revised on the basis of new experience, whilst others like Gustav Schmoller and his school despaired and doubted if there were any solid scientific principles of any value in economics; the latter were inclined to assume that the statesman's profession was to govern, according to his judgment and on the merits of the circumstances, now in the direction of free-trade and now in a protective sense.

It was only between 1900 and 1914 that a fundamental controversy of theorists on free-trade and protection in Germany was fought out in broader circles. Some like Arndt, Brentano, Dietzel, Gothein, Helfferich, Lotz, v. Schulze-Gävernitz were in favour of lowering import duties, or of free-trade; others like Diehl, v. Mayr, Oldenberg, Pohle, Sering, Schumacher defended high protective duties. But for the outbreak of the war of 1914, Germany would have seen a decisive battle between free-traders and protectionists, as England did in the days of Cobden and Sir Robert Peel.

With the political constitution and the protectionist frame of mind among the supporters of the political system as they were from 1892 to 1914, the government could not avoid following a policy of adaptation and compromise, in order to agree as far as possible with the wants of a country with an increasing population which depended on industrial exports and on import of raw materials and food. Compromises prevail in this period not only in Germany's commercial policy, but also in most measures relating to agriculture, industry, communication and transportation, questions of labour and of public finance.

The task for German science was to digest tremendously complicated problems, and to understand permanent changes in the character of the economic and social life of a suddenly developing country.

The method adopted for mastering these difficult problems was to make use as far as possible of experience. Specialists studied the

different questions of the day with great diligence and skill, but felt obliged to refrain from generalisations. It seemed to be rash to utter general conclusions when problems every day became more complicated and more difficult to solve.

Descriptive methods were applied to the study of agricultural questions. Serious people investigated whether production on a large or small scale was making progress in agriculture. The conclusion was that, in agriculture, production on a large scale was not advancing as in industry. Even some of the adherents of Karl Marx felt forced to revise their general dogma that everywhere production on a large scale was advancing. Special enquiries were also undertaken concerning the law of inheriting land, co-operation in agriculture, agricultural taxation, agricultural labour, and small holdings ("Innere Kolonisation"). It seemed necessary to observe closely the effects of former feudalism upon the agricultural phenomena of the present time. Valuable monographs of Aereboe, Brentano, Conrad, Esslen, Knapp, Sering, Max Weber, Wygodzinski, and their followers, also of socialists like David and others, contributed to deeper knowledge of several problems of agriculture.

Whereas the agricultural leaders were not satisfied with the policy of compromise represented by the government and strove for higher prices for corn and cattle, an agrarian movement in favour of bimetallism and against exchange-business in agricultural products began. The questions of bimetallism and of sales for future delivery excited general interest. In the controversy, "Bimetallism against the Gold Standard," the different standpoints were defended by Arendt, v. Kardorff, Wagner on one side, and by Bamberger, Helfferich, Lexis, Lotz on the other. Questions of exchange-business were enquired into by Gschwindt, Pfleger, Max Weber, Wiedenfeld.

Banking problems were treated of in monographs by Hecht, Jaffé, Lotz, Obst, Plenge, Riesser, Schulte, v. Schulze-Gävernitz, Sartorius von Waltershausen, Ad. Weber, also by the socialist Hilferding.

As to communication and transportation the official policy adhered to Bismarck's protective traditions. Inland waterways and maritime navigation emancipated themselves from this influence. A great number of authors discussed these developments from different standpoints (v. d. Borght, Sax, Ulrich, Sympher, Wiedenfeld, Vogel, v. Beckerath, Lotz, Schumacher, Thiess).

The housing question and the problem of land values became a domain of special enquiry cultivated with much diligence by Eberstadt, Fuchs, Pohle, Voigt, Ad. Weber. A branch of the movement in favour of land nationalisation, at least in favour of increment duties, arose also in Germany (Oppenheimer, Damaschke, etc.).

Since commercial relations with other countries showed greater importance every day, literature relative to Russian, British, French, and American imperialism excited much interest. A good deal of investigation was undertaken to spread knowledge on the development of foreign countries and on colonial questions (United States: Sering, von der Leyen; Australia: Manes, Schachner; Russia: v. Schulze-Gävernitz; Ireland: Bonn; Spain: Leonhard; Italy: Sombart; permanent service of publications by the Colonial Institute at Hamburg, and by the "Weltwirtschaftliche Institut" at Kiel, under Professor Harms).

Many industrial problems were treated in a vast number of publications: the phenomena of continuation of older organisations in the modern capitalistic spheres, for example handicraft and home industry (sweating system). A special branch of economic science, industrial morphology, developed. It was cultivated by Bücher, v. Philippovich, Sombart, Stieda. A good deal of work was also done in investigating the causes and forms of industrial production on a large scale (Sinzheimer, v. Schulze-Gävernitz), and the conditions of success of trusts, cartels, and other industrial combinations (Brentano, Eulenburg, Kestner, Liefmann, Vogelstein).

A special training, which has been cultivated since the rise of Germany's high schools of commerce, had as its object of study the technique of commerce ("Privatwirtschaftslehre": Nicklisch, Schmalenbach, Leitner, Schönitz, Hirsch).

No special question of political economy met with more interest and gave origin to more enquiries than the industrial and agricultural labour question. Bismarck had originated national social insurance, but he did not sympathise with the endeavours of workmen to help themselves by trade-unionism and co-operation. The anti-socialist law under Bismarck, which rendered the movement of workmen for better wages and shorter hours of labour very difficult, was repealed when Bismarck retired. The laws protecting children and female operatives in factories were, after Bismarck's resignation, much improved; a wonderful development of trade-unionism and co-operative societies began. In the socialistic group, heretofore rigidly dependent on the dogma of Karl Marx, an emancipation from this dogma made itself felt ("Revisionists": Bernstein, etc.). As the organisations of workmen and employers became better disciplined, the problems of conciliation and arbitration ("collective fixing of labour conditions") attracted the public interest more and more, and gained immediately before the revolution even the sympathy of the government (Brentano, Francke, Hertling).

An excellent synthesis of experience in labour questions, also including a survey of the labour movement and labour legislation in other countries, is contained in Herkner's *Arbeiterfrage*, and in a book by Zwiedineck.

The relations between pleasure in labour, between wages, hours of labour, and efficiency of labour were studied by Abbe, Brentano, Kräpelin, and many others.

As to monetary questions, for many years there had been a struggle between bimetallists and monometallists, but the gold standard system had practically gained the victory. The then prevailing theory was summarised in Helfferich's *Das Geld*. Since the end of this controversy a new heterodox doctrine on money was proclaimed by Simmel and Knapp, "Nominalism against Metallism." This theory of "state-born money" endeavoured to show that paper money was not an anomaly, but just as normal as metallic currency. Most theorists (v. Bortkiewicz, Lotz, v. Mises) opposed this "descriptive theory of money." Knapp is careful not to explain the relations between currency and prices. This was merely an academic controversy before the war. Since the war everybody in Germany has felt the effect of depreciated currency on all economic matters.

Students who wish to obtain a survey of the detailed scientific work of German economists in this period ought to consult, in the first place, the monographic literature, the dissertations and the publications of the *Verein für Sozialpolitik*. A synthesis of the practical results in economical policy of these enquiries is contained in the works of Philippovich, vol. ii.; Roscher, vols. ii., iii.; for agricultural policy in Buchenberger's work, for commerce and transportation in G. Cohn's work, in Conrad's *Grundriss*, vol. ii.

Not only was the descriptive and comparative method cultivated, but at the same time much work was done in economic history. Schmoller and his school compiled from government documents materials for a history of German, especially Prussian administration. The facts being told here as they were seen by the governing bodies, another group of economists endeavoured to describe the historical facts as seen from below, such as social conflicts of classes and realisation of ever-working historical tendencies (Max Weber, Brentano, Bücher, Gothein). From a more professional view of political history the problems of economic development were reviewed by v. Below, Dopsch, Hartmann, Ehrenberg, Seeliger, Strieder.

Very much talked of was a theoretical synthesis of the detailed investigations in economic history put forward by W. Sombart in his work, *Der moderne Kapitalismus*. Many assertions of Sombart have been contested by Brentano and Strieder. Nevertheless Sombart's work is appreciated as full of ideas and suggestions.

Further additions to the analysis of economic facts, beside the descriptive, comparative, and historical investigations, were made by the improvement of statistics (Knapp, v. Bortkiewicz, Conrad-Hesse, Kuczynski, Ballod, Meitzen, Mombert, Eulenburg, Schott, Würzburger, Zahn).

After all this analytical work no theorem of the classical school of economics seemed to be so indisputable as to need no additions or revision.

New facts especially were produced to revise Malthus' theory of population, to study the influence of technique on economics (Brentano, v. Gottl, v. Schulze-Gävernitz, Sinzheimer), the influence of law and administration on economics (Stammler, Schmoller). Even in the theory of value it was acknowledged that an exclusive disposition of commodities guaranteed by the state in every social organisation is always imagined by people who value commodities for use or for exchange (Kaulla).

The classical school of political economy had regarded economical man as a normal type, always personally free, producing in free competition and impelled by a prevailing tendency to make money. The progress of sociology showed that not free individuals but communities as joint families, etc., existed in primitive stages of the development of mankind. It was in consequence of this sociological knowledge that village communities and primitive family organisations were studied and the effects of evolution were further considered. The study of philosophy necessitated the revision of the psychological foundations of economics. The classical theory of the "economic man" did not seem to be enough. Schmoller laid special stress on the ethical motives in economics; Brentano enquired into the development of wants as economic motives in different phases of civilisation.

In connection with the Austrian school (Menger, v. Boehm-Bawerk, Zuckerkandl, v. Wieser) the theory of the final degree of utility ("Grenznutzen") was adopted.

The theory of commercial crises and depressions was the subject of special studies, and also the movements of prices.

The sociological foundations of modern economic life were more earnestly studied. Max Weber died before having accomplished a universal systematic enquiry into the influence of religious ideas upon economic life.

His brother, Alfred Weber, began examining the laws of localisation of industries in continuation of former investigations of v. Thünen.

If uncontested results were obtained in the above-described sections of theory, the same

agreement was not attained until 1921 in questions of revenue, interest and profit, land rent, etc. (controversies: Liefmann, v. Schanz, v. Böhm-Bawerk, Oppenheimer, etc.).

An important controversy on method originated in the *Verein für Sozialpolitik*—the controversy on valuation of economic measures (Werturteilfrage). One group (M. Weber, Sombart) held the opinion that it was not true that science was able to formulate rules for practical use. They demanded that economists should describe and analyse facts irrespective of what ought to be done, the latter being the domain of politicians. Another group (Schmoller, v. Mayr, Ad. Wagner) did not follow this view.

In general, analysis of details preponderated in this period of economic work over synthesis. The difficulties of a synthetic system were enormous, since the material is so great that it had become a very hard task to survey the whole. Two ways of synthesis were possible: co-operation of many specialists (*Handwörterbuch der Staatswissenschaften*, the standard work of German economic science of to-day, Elster's *Wörterbuch der Volkswirtschaft*, Mischler and Ulbrich's *Oesterreichisches Staatswörterbuch*, *Grundriss der Sozialökonomik* by Altmann, Brinkmann, Bücher, Esslen, etc., Stegemann's *Handbuch der Wirtschaftskunde Deutschlands*), or a handbook written by one author. The best syntheses of modern theory are perhaps the handbooks of Lexis, of Roscher, and of Philippovich. Schmoller's handbook devotes more interest to sociological questions than to pure theory. Ad. Wagner's handbook, which contains many parts not of descriptive character but of social programmes of the author, occupies a special position. The principles of economic theory of Dietzel and of Schumpeter do not cover the whole system, but contain brilliant parts. Schumpeter has also published the best modern survey of the history of political economy as a science. The work of Diehl is especially concerned with the history of economic science. A more elementary primer of political economy without much regard to the latest progress of theory is the book of Joh. Conrad.

Generally the interest in the pure theory of economics, which until 1900 took a secondary rank compared with practical, statistical, and historical problems, increased much in the last decade before the war (Pohle, Dietzel, Wolf, Spiethoff, Eulenburg, Voigt, Ad. Weber).

During and after the war a huge literature on war economics, a discussion of the numerous regulations of economic life by administrative bodies, came into existence (*Kriegswirtschaftsfragen*). Since the revolution a good many books have discussed the problems of nationalisation and municipal socialism (*Sozialisierung*).

One area of economics had been for a long time relatively isolated from the progress of the method of descriptive and comparative investigation: public finance. As long as there were no financial difficulties, this branch was somewhat neglected in Germany. A great many authors were occupied in constructing programmes of what ought to be done from the standpoint of justice. Political programmes prevail in the writings of A. Wagner, Jastrow, v. Mayr, Cohn. More descriptive and comparative work was done by Neumann, v. Schanz, Gerloff. Elementary handbooks of public finance were produced by v. Eheberg, v. Heckel, Conrad, Cohen, Altmann, v. d. Borght, v. Tyszka; an endeavour to review public finance from a comparative and descriptive standpoint is the book by Lotz.

The investigations which form the basis of economic work in Germany until 1914 were possible as long as rich public and private means were at hand for scientific purposes; many descriptive works were printed, many scientific periodicals (Schmoller's *Jahrbuch*, Conrad's *Jahrbücher*, *Finanzarchiv*, *Zeitschrift für die gesammte Staatswissenschaft*, *Soziale Praxis*, *Zeitschrift für Sozialwissenschaft*, *Archiv für Sozialwissenschaft und Sozialpolitik*, *Sozialistische Monatshefte*, *Weltwirtschaftliches Archiv*, *Bank-Archiv*, *Vierteljahrsschrift für Sozial- und Wirtschaftsgeschichte*, etc.) gave an opportunity for publications. Printing and paper were cheap. All this is changed since 1918.

The consequences of the war and of the revolution, the financial burden of the Peace of Versailles, the difficulties of competing in the world's markets, give a gloomy aspect to Germany's future economic position. In a very poor country means for scientific work will not easily be found. It would be a wonder if the economic science of Germany were able to defend its position in the coming period of very hard times.

See *Die Entwicklung der deutschen Volkswirtschaftslehre im neunzehnten Jahrhundert*, Gustav Schmoller, dargebracht von Altmann, Ashley, Ballod, etc., 2 vols., Leipzig, 1908.—Joseph Schumpeter, "Epochen der Dogmen- und Methodengeschichte" (in *Grundriss der Sozialökonomik*, vol. i.), Tübingen, 1914. W. L.

GIBBINS, The Rev. Henry de Beltgens (1865-1907), born at Port Elizabeth, Cape Colony, was educated at Bradford Grammar School and at Wadham College, Oxford, obtaining the Cobden University prize in 1890. After holding various posts connected with education in England, he was appointed Principal of Lennoxville University, Canada, in 1906, but resigned soon after owing to ill-health and returned to England. He retained an interest in economics during his life, and his works, which were largely historical, were widely read and popular. His *Industrial*

History of England went into ten editions in fifteen years; his *Industry in England* and *The English People in the Nineteenth Century* are both in their third edition; and he also wrote *The History of Commerce in Europe*, 1891, *English Social Reformers*, 1892, *British Commerce and Colonies*, 1893, *Industrial and Commercial Progress of the Nineteenth Century*, *Economics of Commerce*, 1905, and a history of Kidderminster School, of which he was for a time headmaster. He also edited the *Social Questions of To-day* series, and frequently wrote in the reviews.

He contributed to this *Dictionary* the articles on GOLDSMITHS, GOLDSMITHS' NOTES; GOVERNMENT REGULATION OF INDUSTRY, discussing the earlier history of Taxation; PRE-ROMAN INDUSTRY IN BRITAIN; and the Biographies of RICHARD OASTLER and MAX STIRNER.

Mr. Gibbins' early death by an accident cut short a career which, if prolonged, might have produced further useful results.

GIFFEN, SIR ROBERT (1837-1910), born at Strathleven, Lanarkshire, was apprenticed to a lawyer there in 1850, and in 1853 removed to a lawyer's office in Glasgow, where he remained till 1860. During this time he attended lectures occasionally at the university. In 1860 he became sub-editor of the *Stirling Journal*. In 1862 he came to London as sub-editor of the *Globe* (1862-66), and after serving for a time on the *Fortnightly Review* became assistant editor of the *Economist* (1868-76). He was also city editor of the *Daily News* (1873-76), and one of the founders of the *Statist*, 1878. In 1876 he was appointed chief of the statistical department at the Board of Trade, and in 1882 became assistant secretary. In 1892 he was made controller of the commercial, labour, and statistical departments, and retired in 1897.

His official career was marked by untiring literary activity. He edited the *Journal of the Royal Statistical Society* from 1876 to 1891, was president of the society from 1882 to 1884, presided over the economic section of the British Association in 1887 and again in 1901, wrote numerous articles on economic and statistical subjects in the leading reviews, and was one of the founders of the Royal Economic Society. His wide knowledge of facts, his sagacious judgment, and his great power of handling statistics lent exceptional weight to his views upon financial matters, and he served upon many royal commissions and committees, notably the royal commissions on the Depression of Agriculture (1893-97), the Port of London (1900-2), and gave important evidence before the royal commissions on the London Stock Exchange (1878), Gold and Silver (1886-88), Financial Relations between England and Ireland (1895-98).

It cannot be claimed for Giffen that he made any important contribution to theory, but his luminous writings contributed largely to the correction of prevalent error, and mark a very high point in economic journalism. He was a strong individualist and a great believer in the power of the body politic to heal itself if left to its own capacity of adjustment to change. He favoured a channel tunnel between England and Ireland, and was an advocate of free banking.

His principal works are *American Railways as Investments*, 1872, written at the suggestion and with the assistance of Mr. Bernard Cracroft of the Stock Exchange (this did much to dispel the distrust of the investing public, and was translated into French by De Laveleye (Liége, 1873)); *The Production and Movement of Gold since 1848*, 1873; *Stock Exchange Securities*, 1877; *Essays on Finance*, first series, 1880 (fifth edition, 1890); second series, 1886 (third edition, 1890); *The Statist on Ireland*, 1886; *The Growth of Capital*, 1889; *The Case against Bimetallism*, 1892; *Economic Enquiries and Studies*, two vols., 1904. He also contributed a chapter to a new edition of Farrer's *State in Relation to Trade*, 1902, and a section on the "Growth and Distribution of Wealth from 1837 to 1887," in T. H. Ward's *Reign of Queen Victoria*, 1887. A posthumous volume on *Statistics* left unfinished was edited by Henry Higgs and G. Udny Yule, and published in 1913. Appreciative notices of his life and work were printed in the *Journal of the Royal Statistical Society* for May 1909, and in the *Economic Journal* for June of the same year.

H. H.

GOLD, DISTRIBUTION AND PRODUCTION OF.* Gold in ancient times was held in great esteem by the Babylonians, Assyrians, Egyptians, Greeks, and Romans, and was won mainly from Egypt and parts of Africa, Arabia, India, and Spain. Though it has been in use for some 4000 years at least, and though until the discovery of America in 1493 there are no quotable statistics (Mulhall mentions £20,000,000 to that date, but the Romans are credited with winning a far greater quantity from Spain alone), it is clear that for size of output one has to come to quite modern times. Of the £3,725,000,000 (876,000,000 fine oz.) produced since 1493, as much as £3,076,000,000 applies to the last seventy years.

The following figures are those of Dr. Adolph Soetbeer to 1885, and since then those of the Director of the United States Mint. The production by centuries has been:

1493-1600 (108 years)	£103,000,000	2·8 per cent.
1601-1700	124,000,000	3·3 ,,
1701-1800	260,000,000	7·0 ,,
1801-1900	1,583,000,000	42·5 ,,
1901-1920 (20 years)	1,655,000,000	44·4 ,,
	£3,725,000,000	100 per cent.

The production for the first twenty years

of the 20th century has already exceeded the total for the whole of the 19th century. It is easily to be seen from these figures that the bulk of the output applies to recent years. This is further brought out by the following:

	Total.	Yearly Average.
1801-1850	£162,000,000	£3,240,000
1851-1860	274,000,000	27,400,000
1861-1870	260,000,000	26,000,000
1871-1880	236,000,000	23,600,000
1881-1890	219,000,000	21,900,000
1891-1900	432,000,000	43,200,000
1901-1910	778,000,000	77,800,000
1911-1920	877,000,000	87,700,000

By countries the figures may be set out as follows:

		Per cent
United States (to 1850)	£30,000,000	
,, (1851-77)	263,000,000	
,, (1878-1920)	547,000,000	
	£845,000,000	or 22·7
Australasia (since 1851)	691,000,000	,, 18·5
Transvaal (since 1884)	660,000,000	,, 17·7
Russia (including Siberia) (since 1814)	345,000,000	,, 9·3
Mexico (since 1521)	123,000,000	,, 3·3
Canada (since 1858)	88,000,000	,, 2·4
India (since 1880)	58,000,000	,, 1·5
Rhodesia (since 1898)	48,000,000	,, 1·3
West Africa (since 1880)	22,000,000	,, 0·6
South America and the rest of the world	845,000,000	,, 22·7
	£3,725,000,000	100

Of the total about 43 per cent has been yielded by countries now forming part of the British Empire, whose proportion, however, in recent years has been about 65 per cent.

In the first half of the last century the output was comparatively stationary, the principal supplies (after 1814) coming from Russia. There have been two epochs of strong increase in the production. On the Californian and Australian (Victoria) alluvial discoveries of 1847 and 1851, the yield rose suddenly from £6,000,000 in 1847 to £30,700,000 in 1853. There was then a long period of declining production until £19,600,000 was reached in 1883. The second epoch was mainly due to the discovery of the Witwatersrand district of the Transvaal (1886), a much larger and more permanent source of supply, and from £24,500,000 in 1890 the output rose almost annually (except for the interruption caused by the Boer War) until the maximum of £96,400,000 was attained in 1915. Since then there has been a noticeable decline annually to the £70,000,000 of 1920, partly as a result of the higher costs resulting from the war, but also as a result of the exhaustion of the mines. Australia has been waning since 1903, the United States since 1915, and the Transvaal since 1916, and indeed all the principal producing countries seem to have passed their zenith. No new fields of importance are to be recorded, and the present prospect, apart from some outstanding discovery, is that the annual figures will remain at about the present level for years to come.

Until comparatively recently the bulk of the gold was won from alluvial, Russia, California, and Australia (at first at least) being alluvial diggings. As time wore on lode mining became important, and later still banket (conglomerate), which is confined to the Witwatersrand and the Gold Coast Colony, has figured largely. The changes are set forth in the following table, wherein the figures to 1890 are taken from Eduard Suess, *The Future of Silver* (1893):

	From Alluvial.	From Lodes.	From Banket.
1848-75 (average)	£19,300,000	£2,700,000	Nil.
1875	13,000,000	7,000,000	Nil.
1890	10,800,000	11,700,000	£1,900,000
1904	13,000,000	42,700,000	15,500,000
1911	18,000,000	43,000,000	34,000,000
1919	10,000,000	28,000,000	34,000,000
Proportions of Total Output.			
1848-75 (average)	88 per cent.	12 per cent.	Nil.
1875	65 ,,	35 ,,	Nil.
1890	44 ,,	48 ,,	8 per cent.
1904	18 ,,	60 ,,	22 ,,
1911	19 ,,	45 ,,	36 ,,
1919	14 ,,	39 ,,	47 ,,

Thus mining for gold has largely passed from the hands of the individual digger into that of companies, which indeed also produce a large proportion of the alluvial output of to-day.

The destination of the output may be given roughly as follows:

		Per cent.
Stock of gold money (excluding India and Egypt)	£1,950,000,000	or 52½
Industrial arts (Europe and America)	1,175,000,000	,, 31½
India's absorption	475,000,000	,, 12¾
Egypt and China's absorption, etc.	127,000,000	,, 3½
	£3,727,000,000	100

J. K.

GOLD, INCREASE IN THE PRODUCTION OF. The article under the heading of GOLD, DISTRIBUTION AND PRODUCTION OF, shows that in the history of the world there have been two epochs of strong increase in the output, the annual figure rising after the Californian and Australian discoveries of 1847 and 1851 from £6,000,000 in 1847 to £30,700,000 in 1853, and after the discovery of the Witwatersrand in 1886 from the £19,600,000 of 1883 to £96,400,000 in 1915. Since then the figure has fallen off 27½ per cent in five years, a proportion not far different from the decline in the thirty years to 1883. These changes in the production have exercised a strong influence on the aggregate world's stock of gold money per head. The writer estimates that this stock amounted to £200,000,000 in 1843, £400,000,000 in 1858, £800,000,000 in 1894, £1,600,000,000 in 1913, and £1,950,000,000 in 1920. The figures of this stock of gold money (which are exclusive of India and Egypt)

are made up by adding to an assumed £200,000,000 in 1843 the amount of the annual output of gold after deducting therefrom the net amount used in the industrial arts as estimated by Dr. A. Soetbeer and the United States Mint, the absorption of India as judged by its net imports and its own production of the metal, Egypt's net imports (since 1878), and China's net exports (since 1906). The method can be seen from the following, which also serves to show the important proportions of the output claimed by the industrial arts and India :

(In Millions of Pounds.)

	Industrial Arts.	India.	Egypt and China.[1]	Balance added to Stock of Money.	World's Output.
1835-1844	25	3	?	6	34
1845-1854	31	10	?	115	156
1855-1864	52	51	?	160	263
1865-1874	101	35	?	118	254
1875-1884	112	22	14	68	216
1885-1894	102	16	7	140	265
1895-1904	144	55	26	334	559
1905-1914	215	146	21	518	900
80 years	782	338	68	1459	2647
1915-1919	(90)	51	16	273	430
85 years	872	389	84	1732	3077
Proportions	28¼%	12⅝%	2⅝%	56¼%	100%

It will be seen that the demand by industry and India was enormously accelerated by the outpouring of Californian and Australian gold, that it then paused or retroceded when the output fell off, and that it again became accentuated with the great increase in output after the discovery of the Witwatersrand. This is, of course, only another way of saying that the demand is largely conditioned by trade.

This method of arriving at the stock of gold money, coupled with an estimate of the world's population at the various dates, leads to the following figures :

	Total Gold Money.	Per Head.	Increase per Head.
	£		
1840	197,000,000	51d.	Nil.
1850	230,000,000	55d.	4d.
1860	433,000,000	95d.	40d.
1870	556,000,000	111d.	16d.
1880	643,000,000	119d.	8d.
1890	720,000,000	121d.	2d.
1900	989,000,000	154d.	33d.
1910	1,454,000,000	208d.	54d.
1915	1,735,000,000	238d.	30d.
1919	1,928,000,000	258d.	20d.

The average worked out at between 50d. and 55d. per head from 1790 to 1850, rapidly rose after the Californian and Australian discoveries to 111d. in 1870, became virtually stationary until 1893, when 127d. was reached, and then took another strong upward turn until to-day's 258d. per head. Thus between 1850 and 1870 the figure more than doubled, and between 1893 and 1919 it again more than doubled. There have therefore been four long swings of movement—stationary in the sixty years to 1850, strongly rising in the following twenty years, virtually stationary again for the twenty-three years to 1893, and again strongly rising for the twenty-six years since. As will be shown later, the last period will now probably be succeeded by another long lull. These movements have had a profound effect on economic factors such as foreign trade, bankers' clearing-house returns, incomes, wages, the rate of interest, and the prices of commodities. In the periods of rise in the stock of gold money per head (which is taken as representative of money or credit generally) all these factors have advanced markedly, and in the periods of lull the first four factors mentioned have lulled too, while the rate of interest and prices have fallen. This may be illustrated in the case of the foreign trade of the United Kingdom as follows, maximum or crisis years being taken for trade, and a lag of five years being assumed for the stock of gold money to exert its influence :

Gold Money per Head (World).			Foreign Trade per Head (U.K.).		
		Increase.			Increase or Decrease.
1852	63d.	....	1857	£11·7	....
1861	97d.	34d. or 54%	1866	17·5	£5·8 or 50%
1868	109d.	12d. or 12%	1873	21·0	3·5 or 25%
1877	118d.	9d. or 8%	1882	20·3	−0·7 or −3%
1885	118d.	Nil.	1890	19·8	−0·5 or −2%
1895	134d.	16d. or 13%	1900	21·1	1·3 or 6%
1902	163d.	29d. or 22%	1907	26·4	5·3 or 25%
1908	198d.	35d. or 22%	1913	30·5	4·1 or 16%

We get a rise in trade of 79 per cent in sixteen years, a fall of 6 per cent in seventeen years, and a rise of 54 per cent in twenty-three years, as compared with increases in gold money of 73 per cent, 8 per cent, and 68 per cent respectively.

The percentual changes are as close as could be expected, and there is indeed remarkable agreement. To get the influence of the stock of gold money on prices, we have most effect if we select materials only, and we then get, on Mr. Augustus Sauerbeck's index numbers, and taking again maximum or crisis years :

Gold Money per Head (World).			Prices of Materials (Sauerbeck).		
		Increase.			Increase or Decrease.
1842	50d.	....	1847	86	....
1852	63d.	13d. or 26%	1857	107	21 or 24%
1859	92d.	29d. or 46%	1864	119	12 or 11%
1867	107d.	15d. or 16%	1872	115	−4 or −3%
1875	116d.	9d. or 8%	1880	84	−31 or −27%
1885	118d.	2d. or 2%	1890	71	−13 or −15%
1895	134d.	16d. or 14%	1900	80	9 or 13%
1902	163d.	29d. or 22%	1907	86	6 or 7%
1908	198d.	35d. or 22%	1913	91	6 or 6%

[1] Egypt from 1879 and China from 1907.

There was thus a rise in prices of materials of 34 per cent in twenty-five years, a fall of 38 per cent in the following eighteen years, and then a rise of 28 per cent in the last twenty-three years, as compared with advances in gold money of 114 per cent, 10 per cent, and 68 per cent respectively — considerable rises in the two periods when the stock of gold money was advancing rapidly, and a considerable fall in the intervening period when it was virtually stationary. If food prices were included, there would be similar but less accentuated results, owing to the comparative sluggishness of food prices — a rise of 17 per cent from 1847 to 1873, a fall of 35 per cent from 1873 to 1890, and a rise of 18 per cent from that year to 1913.

The way in which these cases swing to the gold-money pendulum can perhaps be better seen, coupled with other factors, in the following grouping, approximations being given in brackets where actual figures are not available. The four intervals represent successive stationary, rising, stationary, and rising periods, and the years chosen are years of maxima :

	1825	1847	1873	1890	1913
Gold money per head (five years earlier)	53d.	50d.	109d.	118d.	198d.
U.K. trade per head	(£4·0)	(£5·5)	£21·0	£19·8	£30·5
London bankers' clearings per head	(£35)	(£45)	£187	£207	£359
Taxpayers' incomes per head, U.K.	(£9)	£10·6	£17·6	£18·8	£26·9
Wages, U.K. (Index No.)	63	55	87	90½	106½
Wholesale prices : food	(115)	105	107	73	77
Wholesale prices : materials	(120)	86	114	71	91
Wholesale prices : all commodities	117	95	111	72	85
Bank rate (nine years' average)	4·37%	3·54%	3·39%	3·19%	4·28%

The 1825 figures were, of course, still affected by the nearness of the Napoleonic wars. The only notable exception to the general rule that these factors follow the lead of gold money is to be found in the case of the bank rate between 1847 and 1873.

It can then be said with confidence that the stock of gold money (as the representative of money or credit in the larger sense) has a very material, indeed dominating, influence in respect of trade, prices, and other economic factors.

The increase in the stock of gold money per head was especially prominent during the war, owing to the restricted demand on the annual production of gold by industry and India, and it reached 238d. in 1915, 246d. in 1916, 251d. in 1917, and 258d. in 1918. From then the figures are likely to pause. The gold production for the near future can be measured to a certain degree, and, taking seven-year intervals from the last figure given in the foregoing tables, we should get as a picture of the possibilities :

1915 Gold money	238d. per head.	Increase	40d. or 20%
1922 ,,	260d.	,,	22d. or 9%
1929 ,,	270d.	,,	10d. or 4%

We are therefore probably approaching another period (as was experienced between 1873 and 1890) when one would in normal times expect stationary trade and falling prices (as compared with what they would have been if there had been no Great War), but there is still time, owing to the five-year lag, for the pre-war rise in prices to make further headway, though under cover of and concealed by the abnormal (and partly paper) prices produced by the war. This does not of course mean that the war prices will not be greatly reduced, nor does it take account of any special depression produced by the effects of the war.

Apart from the production prior to the discovery of America (estimated, but evidently far too moderately, at £20,000,000 and £40,000,000 respectively), the output of gold and silver has reached the stupendous total of £6,200,000,000, of which two-thirds has been obtained since 1850 :

	Gold at 84/11¾ per fine oz.	Silver at Commercial Value.	Percentage of Value.	
			Gold.	Silver.
1493-1600	£103,000,000	£195,000,000	34·5%	65·5%
1601-1700	124,000,000	318,000,000	28·0%	72·0%
1701-1800	260,000,000	488,000,000	34·7%	65·3%
1801-1850	162,000,000	280,000,000	36·7%	63·3%
	£649,000,000	£1,281,000,000	33·6%	66·4%
1851-1900	1,421,000,000	801,000,000	64·0%	36·0%
	£2,070,000,000	£2,082,000,000	49·8%	50·2%
1901-1920	1,655,000,000	510,000,000	76·4%	23·6%
	£3,725,000,000	£2,592,000,000	59·2%	40·8%

Up to 1850 the proportions were fairly constant at one-third for gold and two-thirds for silver. Since that time these proportions have been more than reversed (partly because of the decline in the price of silver since the German demonetisation of 1871-73); the output values of the two metals to 1900 were equal, and gold has now a strong lead.

Prior to 1792 most countries had the silver standard. The United States, United Kingdom, and France adopted the double standard between 1792 and 1803, and the United Kingdom was the pioneer in adopting the gold standard in 1816, though it was not until after the outpouring of Californian and Australian gold that, commencing with Germany in 1871, the most important countries followed its example. The way in which the double standard and then the gold standard have swept over the world is indicated in the following list of changes :

	Silver Standard.	Double Standard.	Gold Standard.
1792	..	United States	
1798	..	United Kingdom	
1803	..	France	
1810	Russia	..	
1816	..	..	United Kingdom

1905	..	Mexico	
1916	..	..	Turkey

To-day China is practically the only important country on a silver basis, and many of the double-standard countries have in effect a gold standard. This is the case with France, Belgium, Holland, Italy, Mexico, and India; though as a result of the war a great many nations have, temporarily at least, superseded the gold by a paper standard.

One of the results of the war was to stop the circulation of gold in most gold-using countries, and to collect it, so far as it was not hoarded into the central banks. The following table shows the gold holdings of the world's state banks and treasuries before the war, after the Armistice, and at June 1920, the figure for the Imperial Bank of Russia after 1913 being necessarily roughly estimated in the absence of published figures. The table excludes various banks which at December 1913 would have added perhaps £70,000,000 to the total:

(In Millions of Pounds.)

	Dec. 1913.	Dec. 1918.	June 1920.
Bank of France	140·3	219·1	223·5
Bank of England (including currency notes cover)	35·0	108·5	146·4
Bank of Spain	19·2	89·1	98·1
Imperial Bank of Russia	151·6	(?) 68·0	(?) 40·0
Reichsbank (Germany)	68·7	113·1	54·6
Netherlands Bank	12·6	57·5	53·0
Bank of Italy	44·3	32·7	32·2
Swiss National Bank	6·8	16·6	21·3
Bank of Sweden	5·7	15·9	14·5
National Bank of Denmark	4·2	10·8	12·7
National Bank of Belgium	10·0	10·7	10·7
Austro-Hungarian Bank	51·7	11·0	11·0
Bank of Norway	2·6	6·7	8·1
Total Europe	552·7	759·7	726·1
United States Treasury	266·0	525·0	445·0
Argentina (Caja do Conversion)	46·2	55·3	83·5
Total America	312·2	580·3	528·5
Bank of Japan	22·6	72·6	98·0
Indian Treasury	21·3	13·2	30·6
Total Asia	43·9	85·8	128·6
Dominion Govt., Treasury	23·7	25·0	21·0
Chartered Banks of Canada	7·8	15·5	16·6
Commonwealth Bank	4·5	21·3	23·9
Total Colonies	36·0	61·8	61·4
Grand Total	944·8	1487·6	1444·7

Thus during the five war years Europe added £207,000,000 to its state bank holdings, the United States Treasury and Argentina £268,000,000, and Asia and the Colonies £68,000,000. The United States as a whole (including banks and in circulation) rose from £392,000,000 (25 per cent of the world's stock of gold money) at the end of 1913 to £651,000,000 (34 per cent of the world's stock) at the end of 1918, falling to £553,000,000 (28 per cent of the world's stock) eighteen months later. The period since the Armistice is remarkable for the loss of gold by the United States and Germany, and for the gain in Argentina, Japan, and the United Kingdom.

During the six and a half years to June 1920 the writer estimates that the world's stock of gold money increased £353,000,000 out of new production, while the stock in the state banks and treasuries tabulated increased by £500,000,000, so that the amount in private banks, hoarded and in circulation, should have fallen by £147,000,000. The latter reduction would be proportionately far greater in particular countries. The gold in the United Kingdom at 30th June 1914 amounted to £161,000,000 (*First Interim Report of the Committee on Currency and Foreign Exchanges after the War*, Cd. 9182, 1918), of which £38,000,000 was at the Bank of England, £45,000,000 in other banks, and £78,000,000 in the hands of the public. Taking the two latter figures to have been reduced to £50,000,000 at 30th June 1920, and adding £146,000,000 then at the Bank of England, there was a total of £196,000,000, which is £35,000,000 more than before the war. The Bank of England's holding has since increased beyond the £150,000,000 recommended to be stored in the Central Institution by the Currency Commission of 1918.

In the latter part of the war and since to the time of writing, the United Kingdom, the United States, and practically all countries except Australia (where gold does not circulate at present) and Mexico, have ceased to coin gold. This, of course, is merely because gold, as a result of the war, no longer circulates except in Mexico, and only to a minor extent in other countries. It will be many years probably before gold money is in active circulation, but meanwhile it forms a rather slender "cover" for the immense amounts of paper money which have resulted from the war, and the aim of all countries must be to get back to an effective gold standard as soon as possible. J. K.

GOSCHEN, George Joachim, Viscount (1831-1907), was educated at Rugby and Oxford, where he took a first class in *Literis Humanioribus*. His father was a partner in the financial house of Frühling and Göschen, which he joined immediately on his leaving Oxford. He soon became a director of the Bank of England, and entered Parliament in 1863. Into Lord Goschen's brilliant career in Parliament and the many services he rendered to the country, especially as First Lord of the Admiralty, it is not the place to enter here. As an economist he is known by his masterly book on *The Theory of the Foreign Exchanges*, which, written early in his business life, is still the text-book on the subject. *Reports and Speeches on Local Taxation* followed in 1872, and was one of the first books to call attention to this very important subject, as important in its way as imperial taxation. In the volume of *Essays and Addresses on Economic Questions*, published in 1905, Lord Goschen brought together his most important minor writings and speeches on these subjects, among which may be specially mentioned the address he delivered in 1883 to the Philosophical Society of Edinburgh on *Laissez Faire and Government Interference*, in which he showed his alarm at the rapid advance of state socialism. Besides these, Lord Goschen read a paper before the Institute of Bankers on April 18, 1883, on *The Probable Results of an Increase in the Purchasing Power of Gold*. Speaking as he did at a time when the annual supply of gold had fallen off from £36,000,000 a year in 1852, the first year after the gold discoveries, to about £20,000,000 a year, and following on a fresh demand for the precious metal through the establishment of new gold currencies in Germany, Italy, and the United States, the increase in the purchasing power of gold occupied the mind of many almost as much as its depreciation had done in 1848. This paper was a valuable contribution to the elucidation of the extremely difficult and complicated questions involved in the then position of matters. Lord Goschen also published a biography of his grandfather, the publisher of Goethe and Schiller.

In 1890 the Royal Economic Society was founded, Lord Goschen holding the office of president from that year till the date of his death.

The principal part of his economic work, however, was not done in his writings, but in Parliament, where, after holding high office under various administrations, he was Chancellor of the Exchequer, Lord Salisbury being Prime Minister, and between February 1887 and June 1892 he produced and carried through six budgets in succession. In addition to these he conducted in 1888 the immense operation of the conversion of the greater part of the National Debt, in round figures £558,000,000, from 3 per cent, first to 2¾ per cent, and then in 1903 to 2½ per cent, by which a saving of about £2,800,000 a year was made. The reform of the gold coinage, also executed during his term of office, though a much smaller thing in itself, was by no means unimportant, withdrawing as it did some £47,000,000 light-weight coins from the circulation—a work of great convenience to every one in the country, as the condition of the coin of the realm enters into the convenience of the whole population.

Lord Goschen was opposed to Mr. Joseph Chamberlain's policy of tariff reform, but he defended the reimposition by Lord St. Aldwyn, then Sir Michael Hicks-Beach, of the 1s. duty on corn, though he was hostile to any large levy of revenue by taxes on food.

A career spent as Lord Goschen's was, partly in political and partly in business activity, necessarily leaves behind it few written records in comparison with its importance, but those who knew him will long remember his force of character and great acuteness of mind, joined with a width of judgment which rendered his opinions most valuable and influential.

HAGUE CONFERENCES (1899-1920). The first Hague Conference was an assembly of representatives from twenty-six of the independent and civilised states of the world. They came together at the Hague on May 18, 1899, on the invitation of the Netherlands Government—the prime mover being the Emperor Nicholas II. of Russia, who, in August 1898, had proposed an International Conference with the twofold aim of checking and eventually reducing national armaments, and devising means for averting wars "by the employment of pacific methods of international diplomacy." The humanitarian enthusiasm of the young Tsar was, of course, pronounced foolish and impractical. But public opinion was touched by its dramatic

expression and evident sincerity; and there were statesmen of experience who felt that the evils so forcibly described in the Russian rescript were capable of abatement, if not of removal. When a detailed programme was published in January 1899, it became evident that the scope of the proposed Conference had been enlarged by the inclusion of many subjects connected with the laws and customs of warfare. These were matters which appealed strongly to those who prided themselves on being practical as well as progressive. Accordingly, when the Conference met many of the delegates who had come to the Hague expecting to take part in a useless emission of pious hopes and benevolent aspirations were soon convinced, to quote the expressive words of Lord Pauncefote's despatch of July 31, 1899, that "with a little good-will it would be possible to arrive at a common understanding on some of the questions propounded." In fact, all of them were dealt with more or less successfully, except that of disarmament or the limitation of armaments; and, to quote again from the despatch previously cited, "in the brief space of two months, a great international work was accomplished, fraught with the highest promise for the advancement of civilisation and the good of mankind."

But in reality the Conference won its greatest triumph by the mere fact of meeting and recording its wish that another Conference should assemble in the near future. It thus endeavoured to provide the society of nations with a legislative or quasi-legislative body. After some hesitation statesmen came to take for granted that a second Hague Conference must come together before long. The vigorous initiative of President Roosevelt of the United States of America brought matters to a head, though he soon surrendered the leading part to the Russian Emperor. Delays were caused, first by the Russo-Japanese war of 1904-1905, and afterwards by the Pan-American Congress of 1906, but, nevertheless, the second Hague Conference met in June 1907, and sat till October 18, 1907. Forty-six powers were represented at it, as against twenty-six at the previous assembly. Just as the first Conference assumed that it would soon be followed by another, so the second Conference assumed that similar gatherings would take place in future. It regarded itself as a world parliament, and made some kind of rudimentary provision for the periodical assembly of a series of successors, in order that they might deal as regular organs of civilised humanity with its collective concerns. The importance of these steps can hardly be overestimated. They have been taken quite quietly by men, most of whom were driven by forces they hardly comprehended towards aims of which they were scarcely conscious. They are a natural development of international society. They are, therefore, far more likely to be permanent than if they had been forced on by one masterful will, however just and good. Their full significance lies in the distant future. But we can discern even now that in the ethical sphere they mean that justice and reason are to count for more, and brute force for less, and that in the economic sphere they promise a fuller scope for the productive and constructive energies of mankind.

The first Hague Conference drew up three conventions, passed three declarations, gave expression to six wishes, and adopted with unanimity a resolution to the effect that the restriction of military budgets was "extremely desirable for the increase of the material and moral welfare of mankind." This resolution was confirmed by the second Conference, with the addition that "in view of the fact that military charges have been considerably increased in all countries since that year, 1899, the Conference declares that it is highly desirable that the Governments should resume the serious study of this question." The British Government did its best to secure a more practical result; but the more the matter was examined the more difficult did it seem in the prevailing state of feeling to limit the activity of independent states in providing themselves with means of defence. There must be much less of mutual suspicion, and much more of humanitarian zeal, before such restraints can be imposed by general assent and with a fair prospect of general observance. Meanwhile, progress is possible on the line of providing other means than war for the settlement of international disputes. When the vast majority of quarrels are adjusted without war, peoples will first grow restive under economic burdens which every year become less necessary for the protection of national interests, and then find ways to diminish the intolerable strain.

The second Hague Conference was greater than the first, not only in size, but in attempts, in achievements, and in failures. It produced no less than thirteen conventions. It renewed the three declarations of its predecessor. It passed, as we have seen, a resolution on disarmament, and it registered five wishes. But it tried in vain to reach an agreement on the law of contraband and blockade; it proved unable to settle the vexed question of the destruction of prizes at sea; and it laid down most imperfect rules with regard to submarine mines and the duties of neutral states in maritime warfare. Among the best results of its four months' activity may be mentioned the prohibition of the bombardment by naval forces of undefended ports and coasts, the establishment of the immunity of inshore fisheries and authorised mail bags, and the improvement of the work of the previous Conference in matters connected with the laws of warfare on land and the application of the principles of the Geneva

Convention to warfare at sea. Restrictions of space compel the omission of many other topics which were dealt with more or less successfully by the delegates at the Hague. International courts, however, are too important to be omitted.

The Conference of 1899 created a so-called Permanent Court of Arbitration, consisting of four members nominated by each of the signatory powers; and when two states agreed to resort to this court they were to create their tribunal by choosing their judges from the general list. Failing agreement on their part, each of them was to select two arbitrators from the list, and the four so appointed were to choose a fifth. In reality, the Conference merely created the machinery by which a temporary tribunal might be established. It is difficult to call such a body "Permanent" since it only comes into existence for the trial of a particular case, and it is equally difficult to call it a "Court," since the judges are chosen by the parties to the dispute, and are to give their decisions not necessarily on the strict and impartial application of legal principles. It is an arbitral tribunal for "the settlement of differences between States by judges of their own choice and on the basis of respect for law," which may be very different from the application of legal principles in municipal courts. Between 1899 and 1907 several cases were submitted to the Hague tribunal. The credit of providing the first of them rests with the United States, whose Government in 1902 referred to a court of arbitrators, constituted according to the provisions of the Hague convention, a long-standing dispute with Mexico as to the proper destination of what was called the Pious Fund of California. The Venezuelan Indemnities case followed. Great Britain and France were concerned in the Muscat Dhows case, and Japan and several other states in the Perpetual Leases case. So much satisfaction was felt with the decisions, that a strong desire arose for the further development of the principle of arbitration. The arrangements of 1899 were defective in two important particulars. They bound no power beforehand to place its case before a court, and the court they provided was left in a very nebulous condition. The second Conference endeavoured to remedy both these defects. It attempted to formulate a list of subjects which the powers would bind themselves by treaty to refer to arbitration; and it endeavoured to create a permanent court ready at any moment to deal with whatever case might be brought before it by international litigants. The difficulties were too great to be overcome. Some arose out of procedure, some referred to the constitutions of various states, some were connected with the enforcement of awards on recalcitrant litigants, and some were due to the insistence by the smaller states on absolute equality with the greater powers as regards the constitution of the court. T. J. L.; H. H. L. B.

One of the objections to the Convention of 1889 was removed by that of 1907. The method by which three disinterested arbitrators may be appointed makes a nearer approach to a judicial tribunal. Nevertheless, in spite of the imperfections which remained, resort to this tribunal continued.

In 1909 the award was issued in the Casablanca case, in which the parties were France and Germany, and of the Grisbadarna case between Norway and Sweden. These cases were followed by the North Atlantic Coast Fisheries case, between Great Britain and the United States; the Irinoco Steamship Company case, between the United States and Venezuela; the Savarkar case, between France and Great Britain; the Canevaro case, between Italy and Peru; the Russian Indemnity case, between Russia and Turkey; the Carthage and Manouba cases, between France and Italy; and the Island of Timor case, between the Netherlands and Portugal.

Moreover, in compliance with the Convention for the Pacific Settlement of International Disputes, cases have been entrusted to Commissions of Inquiry, invested not merely with the duty of determining the facts in dispute, but of finding liability as well.

Thus on the suggestion of France, and accepted by Great Britain and Russia, a Commission of Inquiry was appointed in the Dogger Bank case in 1904. Another Commission was that to settle the respective claims of France and Italy in the Tavignano, Camouna, and Gaulois cases in 1912.

An International Prize Court was also sought to be established by the Conference of 1907. Hitherto the validity of captures at sea had been tried in the courts of the belligerent captor. Consequently, each maritime state had its own prize law, which sometimes differed from that followed by other states in important particulars.

By Convention XII., an appeal might be taken from the judgment of a National Prize Court to the Prize Court at the Hague. This provision was considered to conflict with the constitution of the United States. It was therefore proposed by Senator Root that the question at issue between the Governments, and not the judgment of the National Court, should be submitted to the International Prize Court. This modification of the Convention was contained in a Protocol signed September 19, 1910, by thirteen Powers and subsequently signed by every signatory of the original Convention.

In spite of this modification, however, and of the fact that the Convention received the approval of the London Naval Conference, 1909, the Convention has never been ratified.

This was due partly to the fact that the Declaration of London, 1910, the result of the Naval Conference, was itself never ratified, and partly to the failure of the signatories to agree upon the method of appointment of the judges.

It has not been generally recognised that none of the Conventions of the Conference of 1907 were legally binding on any of the belligerents during the war. This was due to a clause contained in each of the Conventions, declaring that its provisions are only applicable to the contracting parties when all the belligerents are parties.

Among the belligerents, at the outbreak of the late war, who had not ratified the Conventions of 1907, were Bulgaria, Italy, Montenegro, Serbia, and Turkey; consequently, none of these Conventions were binding on any of the belligerents. But since the Conventions of the Conference of 1899 had been ratified by all the belligerents, it was generally agreed that they were binding upon the belligerents since they had been ratified by all of them. And since the great majority of the provisions of the Convention of 1907 were merely declaratory of the existing International Law and Custom, the fact that the Conventions were not strictly applicable was immaterial, since these provisions, apart from any Convention, had long been recognised as part of the Law of Nations.

Moreover, the British, French, German, and other Prize Courts treated the Conventions of 1907 as if they were legally in force, and in the determination of cases involving the claims of enemy subjects they accorded to them the benefit of rights claimed under any of the Conventions, provided the state of which they were subjects was a party thereto.

The provisions of the Hague Convention relating to the treatment of prisoners-of-war were in practice found to be very inadequate. As early as January 1916 an agreement was reached between the French and German governments for the reciprocal repatriation of civilian prisoners under 17 and over 55, as well as those unfit for military service.

After protracted negotiations, early in 1916 an arrangement for the exchange and repatriation of wounded or sick prisoners permanently incapacitated was concluded between the British and German governments.

Later, an agreement was reached between Great Britain and Germany for the transfer of British and German wounded and sick prisoners to Switzerland, on the lines of a similar agreement already in force between the French and German governments.

By the Anglo-German Agreement, concluded at the Hague, July 2, 1917, an agreement was reached whereby it was agreed that certain combatant and civilian prisoners-of-war to the number not exceeding 16,000 should, by the consent of the Netherlands Government, be interned in Holland, and that additional prisoners should be sent to Switzerland.

It was also a term of this Convention that reprisals should only take place after at least four weeks' notice.

In April 1918 a further agreement was reached between the French and German governments, whereby non-commissioned officers and men who had been in captivity not less than 18 months were to be repatriated, and officers to be interned in Switzerland. This agreement was made applicable to Belgium.

By the Anglo-German Agreement, concluded at the Hague, July 14, 1918, a somewhat similar agreement was reached between the British and German governments.

On June 16, 1920, an International Committee of eminent jurists, appointed by the Council of the League of Nations, met at the Hague, and on July 24 presented a scheme for the establishment of a Permanent Court of International Justice.

The scheme embraced four principal subjects, viz. the composition of the Court; the ambit of its jurisdiction; the law to be administered; and the practice or procedure of the Court. The rock upon which all schemes for an International Court of Justice had hitherto suffered shipwreck, viz. excessive regard to the doctrine of the equality of states, was avoided, by satisfying the representatives of the smaller states that equality meant equal sovereignty, the right of every state to be considered as an individual equally with every other state, but not that every state had an equal position in the world, and that for practical reasons the larger states must have special consideration.

The judges are to be elected, regardless of their nationality, from amongst persons of high moral character, who possess the qualifications required in their respective countries, for appointment to the highest judicial office, or are jurisconsults of recognised competence in International Law. The Assembly and the Council must each frame a list of proposed judges from those persons nominated by the national groups in the Permanent International Court of Arbitration, and those judges upon whom both bodies agree are to be elected; so far as there are differences, further lists are to be submitted. If no agreement is reached, a Committee of Conciliation composed of three members appointed by the Assembly, and three by the Council, may be formed for the purpose of choosing one name for each seat still vacant. If this committee fails to reach agreement, the judges already elected shall proceed to fill the vacant seats by selection from amongst those candidates who have obtained votes either in the Assembly or in the Council.

It will be noted that the Permanent International Court of Arbitration is retained unaltered. Its functions are quite distinct from

those of the International Court of Justice. It is purely an arbitral tribunal, whereas the latter is purely a judicial tribunal. The seat of the court is at the Hague, where the president and registrar must reside. The jurisdiction of the court is confined to litigation between states. An individual as such has no *locus standi*, but as a matter of fact most disputes between states arise out of complaints where wrong has been done by one state to individuals or classes in their state.

By article 32, the court is open to the states referred to in the covenant and such others as shall become members of the League of Nations.

By article 33, when a dispute has arisen between states and it has been found impossible to settle it by diplomatic means and no agreement has been made to choose another jurisdiction, the party complaining may bring the complaint before the court.

And by article 34, the court has jurisdiction between states which are members of the League, to hear and determine cases of a legal nature concerning (*a*) the interpretation of a treaty; (*b*) any question of International Law; (*c*) the existence of any fact which, if established, would constitute a breach of an international obligation; (*d*) the nature and extent of reparation to be made for the breach of an international obligation; (*e*) the interpretation of a sentence passed by the court.

The court has also power to take cognisance of all disputes of any kind which may be submitted to it by general or particular convention between the parties.

Articles 33 and 34, however, have not been accepted by the Council and have been replaced by a new text, keeping the competence of the court within the limits of the covenant and treaties in force.

The law to be administered by the court is by article 35 to be derived from the following sources, viz. :—

(*a*) Positive treaties.

(*b*) The accepted common law of nations.

(*c*) The general principles of law, recognised by civilised nations.

(*d*) Judicial decisions and the teachings of the most highly qualified publicists of the various nations.

Following the precedent of the Supreme Court of the United States, there is no compulsory jurisdiction. It is true that states have been known not to appear before the Supreme Court of the United States, but it is significant that nevertheless the decisions of that court have never been disobeyed.

The procedure is by the well-established method obtaining in arbitration proceedings, viz. by case, counter-case, and reply. It consists of two parts, written and oral. The official language of the court is French. The parties are represented by agents, and they may employ counsel or advocates to appear in court. The hearing in court is to be public. The judgment of the court shall state the reasons upon which it is based, and is final and without appeal. It is, however, open to revision upon the discovery of some new fact of a decisive nature. Unless otherwise decided by the court, each party bears its own costs.

HANSSEN, GEORG (1809-1894), was born at Hamburg and educated there until 1827, when he went to Heidelberg University to study jurisprudence and political economy. Here he came under the influence of RAU. Later he studied agriculture at Würtemberg, and finally graduated at Kiel, where also he lectured. In 1834 he was appointed to a post in the government of Schleswig-Holstein at Copenhagen, and was nominated to the Chamber in 1835. In 1837 he returned to Kiel as professor of Political Economy and Statistics; from 1842 he taught Political Economy at the University of Leipzig till 1848, moving then to Göttingen, where he remained till his death—with an interval from 1860 to 1869, during which he held a professorship at the University of Berlin and a post in the Royal Prussia Bureau of Statistics. In 1869 he resumed his professorial chair at Göttingen, which he gave up in 1884.

Agriculturæ doctrina Cathedris Universitatum Vindicata, Dissert. inaugur., Altonæ, 1832.—*Über die Errichtung von Sparkassen mit besonderer Rücksicht auf Landdistrikte*, Leipzig, 1845.—*Agrarhistorische Abhandlungen*, 2 vols., 1880, 1884 (his most important work). He also contributed largely to periodicals and collective works.

Many of his articles and works dealt with details of the economic position of Germany, with the duchy of Schleswig-Holstein, and with agriculture.

[See *Economic Journal*, vol. v., London, 1895.—*Handwörterbuch der Staatswissenschaften*, giving complete list of works, vol. iv., Jena, 1900.]

HELM, ELIJAH (1837-1904), was the son of a Blackburn cotton-spinner and manufacturer. He was educated at Whalley Grammar School and at Blackburn. On leaving school he entered the cotton trade, and spent a few years at Papiham, where he acquired a knowledge of cotton spinning and weaving. In 1855 he entered a warehouse at Manchester, and continued in the business until, in 1899, he was elected to the post of secretary of the Manchester Chamber of Commerce, of which he had been director for three years. This appointment he held till his death in 1904.

When a young man he attended the evening classes in Political Economy at Owens College, and here came under the influence of JEVONS, and when the latter died Helm lectured at the college until his successor was appointed. He also lectured for a few sessions on Political Economy to the evening classes at the college. The honorary degree of M.A. was conferred upon him in 1902 by the Victoria University. He was an active member of the Manchester Statistical Society, of which he was president for the two sessions 1879-81. Mr. Helm was one of the chief authorities on the economics of the cotton industry, and was well known as journalist and author. He began to write for the *Manchester Guardian* about 1875, and for many years wrote leading articles on financial and commercial questions, especially those relating to India, and on the cotton trade. He was also a frequent contributor to the *Statist*, the *New York Nation*, and other commercial and financial journals in England and America.

His chief writings are—

Chapters in the History of the Manchester Chamber of Commerce, 1899.—*Introduction to Young's American Cotton Industry*, 1902.—The chapters on the Cotton Industry which appear in *British Industries*, Ashley, 1903.—Contributions to the Manchester Statistical Society, published in the Transactions, on the Cotton Trade, Trade Unions, Crises, Bimetallism, etc.—*The Joint Standard*, 1894, attacking the monometallic system, and advocating the establishment of the joint standard. In this dictionary he wrote the articles on CHILDREN'S LABOUR, COTTON FAMINE, and the MANCHESTER SCHOOL. For many years he rendered much service as a social worker in Manchester and district. J. H. J.

HERRMANN, EMANUEL[1] (1839-1902), was born at Klagenfurt in Carinthia, and educated at his native place from 1848 to 1856. He afterwards studied Jurisprudence, History, and Natural Science at various universities, finally proceeding to the degree of Doctor of Law at Gratz in 1862, and acquiring the right to lecture there in 1864. In 1865 he became a lecturer (Dozent) at the Technical University, and Professor at the Trade Schools, in Economics and Statistics, whilst after various similar appointments he obtained the Professorship of Economics and Financial Science at the Technical Academy at Vienna in 1871. He had, however, since 1861 been occupied with work on the Civil Service, and in 1872, though he did not give up his professorial duties, he became head of the newly-formed departments for furthering trade and industry at the Austrian Board of Trade. His position appears to have been somewhat similar to that held by permanent officials in England, as he served under and was controlled by the ministry of the day, and he appears to have played a somewhat similar part in organising the work of his department to that of Sir Robert Giffen and others at the English Board of Trade. The first work of importance that was undertaken was the foundation, apparently by Dr. Anton Bauhaus under his direction, of a large number of the technical schools which did much for the prosperity of many Austrian industries, and which have been to a great extent copied by foreign countries. The condition of Domestic Industries in Austria appears to have occupied much of his thought, for he published an article entitled "Hausindustrie" on the subject in 1873, and in his *Technische Fragen und Probleme der modernen Volkswirtschaft*, 1891, he speaks of the sad impression he had obtained of their condition. In 1882 he was elected to Professorships in Economics and Finance, including one at the Viennese Technical University, and his retirement from the Board of Trade in this year had been preceded by his absence during 1881 on a long furlough, devoted to the study of applied chemistry. He still continued to hold the title of Imperial Privy Councillor conferred on him in 1874, and before his death also became Aulic Councillor (Hofrath). He is one of the two men to be credited with the invention of the Postcard. After his retirement he still continued to publish books at fairly frequent intervals, some of the most important being written between 1882 and 1896.

His work at the Austrian Board of Trade seems to have influenced his development as an economist. His earlier works, though showing signs of those technical and other interests that are so marked in his later ones, are yet mainly—as, for instance, the *Allgemeine Wirtschaftslehre*, 1868—of a theoretical character. He seems, indeed, to have conceived of a wide general system of economics, with narrower applications to narrower areas. "He had especially in view in his work the relations of

[1] Referred to as Emil Herrmann in the *Economic Journal*, December 1902.

technical to industrial developments, and also the creation of a system in which Universal Economics should be the basis, and national and communal economy the superstructure" (*Handwörterbuch der Staatswissenschaften*, q. v.). In his later works, and especially after his retirement from the Board of Trade, his devotion to technical questions connected with Economic Science and their application to it was most marked.

His chief works were:—*Allgemeine Wirtschaftslehre*, 1868.—*Theorie der Versicherung vom wirtschaftlichen Standpunkte*, 1868, 3rd ed. 1897.—*Leitfaden der Wirtschaftslehre*, 1870.—*Miniaturbilder aus dem Gebiete der Wirtschaft*, 1872.—*Principien der Wirtschaft*, 1873.—*Kultur und Natur, Studien im Gebiete der Wirtschaft*, 1887.—*Volkswirtschaft und Unterricht*, 1888.—*Die Familie vom Standpunkte der Gesamtwirtschaft*, 1889.—*Sein und Werden in Raum und Zeit, wirtschaftslehre Studien*, 1889.—*Technische Fragen und Probleme in der modernen Volkswirtschaft*, 1891.—*Wirtschaftliche Fragen und Probleme*, 1893—and *Das Geheimnis der Macht*, 1896. [See *Handwörterbuch der Staatswissenschaften* for a biography of Dr. Herrmann by the Editors, Jena, 1900.] N. B. D.

HOLYOAKE, George Jacob (1817-1906), born at Birmingham, was a weakly child, brought up in poverty. From the age of nine to twenty-two he worked as a whitesmith; when seventeen he obtained some education at the Birmingham Mechanics' Institution and gained prizes in mathematics. In 1839 he became superintendent of the educational classes at the Institution, and afterwards kept a day school in Sheffield. He was appointed a lecturer in 1841 to explain the social system of Robert Owen, and in the following year was imprisoned at Gloucester for six months for alleged atheism, being the last person put on trial for this cause in England. In 1846 he came to London and started *The Reasoner*, which he edited for twenty years. He opened a bookseller's shop in Fleet Street in 1853. In the course of a long and strenuous life he wrote much on political and social questions, advocated the system of thought which he was one of the earliest to call secularism, and took an active part in the promotion of co-operation, temperance, and education among the working classes.

Holyoake told the story of his struggles in *Sixty Years of an Agitator's Life*, 1892, 2 vols. 8vo, and in *Bygones worth Remembering*, 1905, 2 vols. 8vo; the last work describing the progress of the nation within his memory, with special reference to the conditions of life among manual workers. He remembered when men were only paid late on Saturday night, and "poor nailers trudged miles into Birmingham, with their week's work in bags on their backs, who were to be seen hanging about merchants' doors up to ten and eleven o'clock to get payment for their goods."

His writings on co-operation are: *Self-Help for the People, the History of the Rochdale Pioneers*, 1857, 10th ed. 1893, sm. 8vo (the earlier chapters appeared in the *Daily News*); *Life and Last Days of R. Owen*, 3rd ed. 1866, 8vo; *The Logic of Co-operation*, 1873, 8vo; *The History of Co-operation in England*, 1875-79, 2 vols. 8vo, revised and completed 1906, 2 vols. 8vo; *Manual of Co-operation*, New York, 1885 (an epitome of the *History* arranged by the Sociological Society of America); *Growth of Co-operation in England* (from *Fortnightly Review*), 1887, 8vo; *Policy of Commercial Co-operation*, 1888, 8vo; *The Co-operative Movement of To-day*, 1891, sm. 8vo; *Self-Help One Hundred Years Ago*, 1888, 8vo (describes the Society for Bettering the Condition and Increasing the Comforts of the Poor, established in 1796); *Ten Letters, being the Case stated between Co-operators and Private Traders*, 1903, 8vo.

H. R. T.

IMMIGRATION.* Since the first edition of this work appeared, a strong demand has arisen in the United States for drastic restrictions upon immigration, and has led to the prescription of a literacy test for would-be immigrants, and to a proposal to suspend immigration entirely for a short period following the Great War until a permanent policy is fixed.

The argument in favour of this legislative change which has probably carried most weight with the public is derived from the large number and the rapid increase of immigrants. Within the nineteenth century there were only seven years in each of which immigrants to the United States numbered more than half a million; in every year between 1902 and 1914 immigrants exceeded half a million, and in the decade 1905-14 the average annual number was more than a million. This impressive number has been dwelt upon in the annual reports of the Bureau of Immigration, and in thousands of newspaper articles.

Not until 1908 did the Bureau of Immigration begin to report the number of departures as well as arrivals, and thus to measure the net increase of population due to immigration. Even after this change of procedure was made the figure of net increase thus obtained was not emphasised either in the report or in popular discussion. During the seven years 1908-14 inclusive, immigrants numbered 6,709,357, but the excess of arrivals over departures was only 4,069,856, or 60·7 per cent of the number of immigrants; during the five years which followed, the excess of arrivals over departures was only 36·8 per cent of the number of immigrants.

Another qualification of the argument from numbers lies in the fact that a country's power of assimilating immigrants, other things equal,

increases with the population. The ratio of the number of immigrants to the population or to the number of native whites did not increase significantly between 1860 and 1920, but changed irregularly, rising at the end of a decade of unusually heavy immigration, falling if immigration for a decade had been lighter.

Of almost or quite equal importance as an argument to the public was the massing of immigrants in the congested districts of great cities. Under the conditions which had prevailed a generation earlier, the great majority of immigrants quickly scattered over the new land, and processes of assimilation went on rapidly and unnoticed. The opinion that the crowds of immigrants in our great cities were a sluggish indigestible mass came to prevail more and more. Yet these immigrants did not linger or stagnate in urban districts in which they first established themselves; on the contrary, they moved away with great rapidity; but the places they had left were immediately filled by new-comers from abroad.

Whether the process of assimilation has kept pace with immigration cannot be ascertained. But an approximate and determinable index of assimilation is found in the acquisition of English by immigrants. If the number of foreign born who could not speak English is compared with the number of foreign born who had come from a country in which English was not the native language, the following results are reached :—

Date of Census.	Foreign born persons at least ten years of age.		Per cent unable to speak English.	Per cent who have learned English.
	From non-English-speaking Countries.	Reported unable to speak English.		
1890	5,272,000	1,371,000	26	74
1900	6,555,000	1,217,000	19	81
1910	9,796,000	2,953,000	31	69

The per cent unable to speak English varies in close agreement with the per cent of the foreign born who have been in the United States less than seven years. Thus on the average it takes an immigrant not far from seven years to acquire enough knowledge of English to claim that he can speak it. Seemingly this phase of assimilation is keeping pace with immigration, but with a lag of about seven years. In the second generation the process is complete, for nearly 99 per cent of American-born children of immigrants ten years of age or over are able to speak English. Probably the language has been materially debased by digesting these myriads of foreigners, but there is no evidence that Americans are becoming a permanently polyglot folk or are likely to become so if immigration continues as at present.

Another indication regarding assimilation can be drawn from the figures of illiteracy among the foreign born. Of immigrants over 14 years of age entering the United States since 1900, between 24 and 30 per cent were recorded as unable to write any language. But illiteracy among the foreign born in the United States has not increased in thirty years.

Date of Census.	Per cent Illiterates among Foreign Born.
1880	12·0
1890	13·1
1900	12·9
1910	12·7

The preceding figures suggest although they hardly prove that the educational advantages open to immigrants in the United States are keeping illiteracy among the entire body of foreign born at any date down to a little less than one-half of what it has been among new arrivals. Among American-born children of immigrants illiteracy almost disappears. This class is less illiterate than their parents or the coloured population; it is less illiterate than the children of native Americans, many of whom live in regions still imperfectly provided with school facilities.

Another index of assimilation may perhaps be found in the vitality of the immigrants. They have probably on the average less earning power than native Americans, and live under less sanitary conditions. In registration states, including about one-fourth of the population of the country, the expectation of life in 1910 for native white males at the age of 20 was about 1·6 years greater than for foreign-born males of the same age, and for native white females about 2·3 years greater than for foreign-born white females.

The most serious and weighty objection to continuing the former policy of slight restrictions upon immigration is the menace of the immigrant to American standards of wages and of living. The cost of rearing a family in the United States is rapidly rising. In many cases to import labour is quicker and cheaper than to rely on securing a supply from the home market. It is this argument against recent immigration which has contributed most powerfully to change American opinion and the former American policy.

Immigrants who have entered the United States during recent years differ from the resident population in language, social and political traditions, and in economic opportunities open to them on arrival much more than immigrants of one or two generations earlier differed from the resident population of that day. The gap is wider and the changes of the native population of the country result-

ing from assimilating the recent arrivals are doubtless greater, but there is little evidence that the gap lasts longer into the second and subsequent generations, or that the population which finally results is less homogeneous or less loyally united. W. F. W.

INCOME TAX IN THE UNITED KINGDOM * [developments since 1896].

The Income Tax as imposed in 1842 was a strictly proportional tax, subject only to an exemption in favour of very small incomes, but the tax has since been converted step by step into the highly graduated tax now imposed. (On the general question of graduated as opposed to proportional taxation, see GRADUATED TAXATION.) The tax was formerly uniform, but now since 1907 earned income is taxed more lightly than unearned income. Moreover, the family obligations of the individual taxpayer are now taken into account.

After the inquiries held in 1852 and 1861, the reform of the Income Tax was not again the subject of formal investigation until 1904, when a departmental committee was appointed to consider certain specified subjects. In 1906 a select committee was appointed to report upon the practicability of graduating the Income Tax, and of differentiating for the purpose of the tax between permanent and precarious incomes. The reports of these two committees were followed in 1907 and subsequent years by a series of legislative changes which profoundly modified the simple outlines of the original tax, and corrected many of its imperfections.

In 1919 a Royal Commission was appointed to inquire into the Income Tax in all its aspects. The inquiry was comprehensive, and the Minutes of Evidence and Report of the Commission contain full information on all outstanding Income Tax problems. The Commission made many recommendations for the alteration of the tax, but these recommendations, though numerous and far-reaching, do not amount to a suggestion for any fundamental change in the nature of the tax. The Commission reported in March 1920, and the Finance Act introduced immediately afterwards adopted their suggestions with regard to the treatment of earned income, graduation, and relief in cases where tax is paid on the same income in a Dominion and in the United Kingdom. Other recommendations were postponed for later consideration.

Differentiation.—An objection formerly urged against the scheme of the British Income Tax was that it taxed all incomes at the same rate, whether they were permanent or temporary, spontaneous or earned. The select committee appointed in 1906 reported that differentiation between earned and unearned incomes was practicable, and in the Finance Act of 1907 Mr. Asquith introduced a change, reducing the rate of duty charged on the earned income of any person whose total income did not exceed £2000. This relief was modified and extended in subsequent years.

The question was reconsidered by the Royal Commission on the Income Tax appointed in 1919. They reported in favour of the retention of this principle of differentiation, but recommended that relief should be given, not by reducing the rate of duty, but by excluding from assessment a certain proportion (one-tenth) of the earned income. They further recommended that, however large the earned income, not more than £2000 should rank for differential relief, and that the relief should apply with that limitation to incomes of all sizes. Effect was given to these recommendations by the Finance Act of 1920.

Graduation.—The application of a smooth scale of graduation to an Income Tax collected at the source presents great practical difficulties, and the complicated system of abatements and varying rates of duty in force prior to 1920 operated so unevenly between one taxpayer and another, that the removal of the resulting inequalities became one of the most important subjects considered by the Royal Commission of 1919. They recommended the adoption of a scheme to which effect was given by the Finance Act of 1920. Under this scheme an individual resident in the United Kingdom in estimating the amount of his Income Tax liability may claim the following deductions :—

1. One-tenth of his earned income, not exceeding a maximum allowance of £200.

2. A personal allowance amounting in the case of a single person to £135 ; and in the case of a married couple living together to £225, with the addition of a further sum (not exceeding in any case £45) where the wife is in receipt of earned income.

3. The amount of any allowances authorised for children (first child £36, others £27), or for dependent relations.

The excess (if any) of the income over the total amount of the authorised deductions is taxable incomes. The first £225 of the excess is charged at half the standard rate of the tax, and the balance at the full rate.

The income of a married couple living together is treated for Income Tax purposes as a single income. Primarily the husband is assessable for it, but either spouse may claim the right of separate assessment. In that event the benefits of the deductions and the half rates of duty are apportioned between the husband and wife.

Collection at the source of the standard rate of duty is maintained, and the relief is given on a return and claim by the individual taxpayer, either by allowance from profits in respect of which he is directly chargeable, or if necessary by repayment.

This scheme gives a smooth scale of graduation which is effective in the case of moderate incomes, but as the amount of income increases the graduation loses its efficacy by degrees, and becomes almost inappreciable in the case of very large incomes. The scheme is, however, carried on and completed by the imposition of progressive rates of duty on the larger incomes in the form of a super-tax (*q.v.*).

Super-Tax. — The select committee appointed in 1906 to consider the practicability of graduating the Income Tax reported that the tax was already graduated by abatement in the case of incomes not exceeding £700 a year. That further graduation by means of degression on the lines of the existing abatements was practicable, but that there are limits beyond which it cannot be conveniently or usefully extended. That it would be easy to levy a graduated rate of tax according to the total net income of the individual by the method of collecting the whole tax from each person upon his own declaration of income, but they did not think it expedient to abandon the principle of assessment at the source. Finally, that if it were desired to impose a higher rate of tax upon large incomes it was practicable to do so by means of a super-tax, *i.e.* a second Income Tax, distinct from and supplementary to the existing tax levied on individuals by direct personal assessment.

No legislative action immediately followed, but for the year 1909-10 a super-tax was imposed upon individuals whose total income exceeded £5000. The tax was charged at 6d. in the pound upon the amount by which the income exceeded £3000. Since then the point in the scale of income at which super-tax begins has been gradually lowered, and now stands at £2000. Moreover, the simplicity of a single rate has been replaced by a scheme first introduced by the Finance Act of 1914, under which a scale of graduated rates is imposed on successive slices of income. Thus under the scale imposed by the Finance Act of 1920 the first £2000 is exempt, the next £500 is charged at 1s. 6d. in the pound, the next £500 at 2s., and so on by varying slices, until finally the maximum rate of 6s. is imposed on any excess over £30,000. Under this scheme the very large incomes in effect bear a mean rate of super-tax approaching to but never reaching the maximum rate imposed on the income in excess of £30,000.

For the purpose of the assessment of the super-tax for any year the income of the individual chargeable is taken to be the total income of that individual for the previous year, estimated in accordance with the provisions of the Income Tax Acts, but without any deductions for personal allowance, marriage allowance, children, dependent relations, earned income or life insurance. The super-tax payer is also an income-tax payer, and gets due allowance from his income-tax assessments of the deductions authorised under these heads, but he does not receive any further deduction in respect of them when he calculates his total income for super-tax purposes.

INCOME TAX STATISTICS*—Use of, in estimating the National Income. Estimates of national income have always been largely based on Income Tax assessments, and such estimates have been commoner in this country than elsewhere, owing no doubt to the existence since 1842 of an Income Tax in England. The most important of these calculations have been Mr. Dudley Baxter's *National Income*, 1868, Mr. Leone Levi's *Wages and Earnings of the Working Classes in 1881*—following similar researches in 1867 and 1879. To these must be added Sir Robert Giffen's estimate before the Financial Relations Commission, 1894-96 (Q. 7723); his *Economic Inquiries*, 1904, vol. ii. p. 364, and his *Growth of Capital*; Dr. A. L. Bowley's *National Progress in Wealth and Trade since 1882* (1904); Sir Inglis Palgrave's article "The Economic Condition of the Country" (*National Review*, November 1903); and Dr. Bowley's "Tests of National Progress" (*Economic Journal*, September 1904), in which he analyses the Income Tax returns in detail and gives a carefully reasoned estimate of the total National Income, viz. 1800 m. £, afterwards increased to 1945 m. £. Sir Leo Chiozza Money reached 1844 m. £ for 1907, and 2100 m. £ for 1914 (*Riches and Poverty* and *The Nation's Wealth*). Mr. W. H. Mallock and Sir Thos. Whittaker have also made recent detailed estimates. In all of these the method followed has been to get at a sum total of individual incomes by estimating and adding together the total incomes of three classes of the community, viz.: (1) the manual labour class, from official and unofficial estimates of wages and unemployment; (2) the class above manual labour but below the Income Tax limit, computed by averaging estimates for each section; and (3) the Income Tax-paying classes, *i.e.* all those whose income exceeded the exemption limit (£160 from 1894 to 1914). Estimates for the total incomes of the latter class were given in evidence before the Select Committee on Income Tax, 1906, viz. £830,000,000 (Sir Leo Money), £750,000,000

(Dr. Bowley), and £728,000,000 (Sir H. Primrose), who proposed to deduct from this total an estimated sum of £50,000,000 as representing non-personal income to arrive at a total of individual incomes. All these estimates were based exclusively on the Income Tax assessments. They are checked by another estimate made in the *Census of Production Report*, 1907. The most complete analysis of (3) appears in Sir Josiah Stamp's *British Incomes and Property*, 1916. Professor Bowley in *The Change in the Distribution of the National Income 1880-1913*, and *The Division of the Product of Industry, an Analysis of National Income before the War* (1919 and 1920), has made the most recent contribution to the subject, with a result of 2250 million £ for 1913-14. The national income has been roughly estimated at 4000 million £ in 1919, but the data are still quite inadequate for a proper estimate.

The utmost caution, however, is necessary in using the Income Tax returns either for the purpose of estimating the National Income or of testing its growth. As Dr. Bowley observed (*Economic Journal*, vol. 1904, p. 461): "They are full of concealed pitfalls, and it is unsafe to travel in those regions without a guide." Lord Goschen (*Essays and Addresses*, 1905, p. 244) commented on these pitfalls, and explained that "the methods by which the Income Tax is levied and the grouping of the figures by the Inland Revenue in their tables have naturally been devised from the point of view of administrative efficiency and not for the purpose of scientific inquiry." One of these difficulties arises out of the use of the terms "gross" and "net." For purposes of comparison either "gross" or "net" figures, provided that they were throughout taken on the same basis and that no disturbing circumstances had occurred, would be useful, but these terms have not been used throughout the Reports and for different schedules in the same sense. There have also been alterations both in the limit of exemption (£100, £150, £160, £130, at different dates) and in the abatement limits, such as those which forced Lord Goschen, who examined all the indications supplied by the Income and other taxes, to apply all sorts of "harassing qualifications" to his deductions as to the "growth of moderate incomes" in the volume above mentioned. Finally, improvements in administration have undoubtedly accounted for some portion of the increase in the assessed income of the country, and the increasing conversion of private trading concerns into public companies has immensely facilitated the assessment of income and the collection of the tax. Sir Josiah Stamp has devoted a large volume (*British Incomes and Property — the Application of Official Statistics to Economic Problems*) to the analysis and elucidation of these statistics, and their preparation for use by economists. He has recast the tables in order to give figures which are comparable from 1842 down to date, and reference should be made to this work also for a critical examination of all the uses to which income tax statistics have been put and the avoidance of errors in interpretation. The Income Tax statistics are, owing to structure of the tax itself, not easily available for ascertaining the number of Income Tax-payers and the distribution of income among them. Sir Leo Chiozza Money in *Riches and Poverty* has shown how deductions may usefully be drawn from them on these points, and they have been interrogated with interesting results as regards incomes to which the abatement allowances apply (see evidence by various witnesses before the Select Committee on Income Tax, 1906); but they do not yield information for other classes such as was yielded by the statistics of the Prussian and Saxon Graduated Income Taxes. With the growth of the Super Tax, and its clear division of incomes into classes, the field of doubt has become considerably narrower, and it is now possible to state the amount of non-personal income with greater accuracy. The most complete statement appears on p. 90 of the Appendix to the Evidence given before the Royal Commission on the Income Tax, 1920.

The Income Tax assessments, with the limitations and possibilities thus indicated, supply, of course, only one among many indications which must be consulted before any estimate of National progress can be attempted. Besides wages, there are the banking and savings bank statistics, statistics of consumption, and the statistics of export and import trade, to which should be added statistics of home trade and production and census statistics—see Dr. A. L. Bowley's *National Progress in Wealth and Trade since 1882* (1904), a forcible plea for the better organisation of the statistical information bearing on this question. And as regards the Income Tax itself, a serious question arises, connected not with the form of the statistics, but with economic considerations, which an inquirer must answer before he can decide how far a growth of the assessments is a real guide to national progress. It has often been maintained that certain classes of income, described by Mr. Levi as "second hand" or "dependent" incomes, ought to be excluded from the calculation in computing the national income; such incomes especially as are derived in increasing numbers in the form of salaries from the State or municipalities, *i.e.* from taxes and rates. The question may be taken in connection with that raised by J. S. Mill when, in the introduction to his *Principles of Political Economy*, he maintained that the National Debt cannot be counted as part of the national wealth, nor the interest on it as a part of the

national income. And if the argument involves the exclusion of the interest on the National Debt on the ground that this interest is paid out of the income of other people, and the assumption that to include it would be to count "one portion of the general income twice over," does it apply equally to the case of all "second-hand" incomes—not only to the incomes derived from the State or from municipalities, *i.e.* from taxes or rates, but also to incomes like those of employees of public companies or those paid by private employers?

The theory alluded to was accepted by Mr. Dudley Baxter, who accordingly in his estimate of the National income in 1868 divided income into that of the "Productive," "Auxiliary," and "Non-productive" classes; and also partially by Mr. Leone Levi in 1885 when he gave what he called a "gross" and "net" figure of National income. Sir Robert Giffen in his *Growth of Capital*, it may be added, excluded the National Debt from the computation—not proportionately a very serious deduction from his total figures,—but in giving his reason he said (p. 21) that he "should not censure very much any one who included the National Debt as a part of the capital of the community."

More recent calculations of the national income do not appear to have made these allowances for "second-hand" income, to which indeed no very practical importance seems ever to have been attached, though at one time the matter was regarded as theoretically important. Take the case of a landowner and a manufacturer respectively each with a gross income of £50,000 a year. The landowner may pay £5000 a year in rates and taxes, £1000 to an agent or secretary, and £300 to a cook. On Mr. Levi's theory not only would these payments have to be deducted before reaching the taxable income, but all other payments in the shape of wages or ordinary expenses of living which go to form the income or increase the profits of any other person. Very few modern writers place any stress upon this point. But Dr. Bowley has remarked that "it is doubtful whether a perfectly definite meaning can be attached to total national income. . . . The total is more correctly a total estimated value of services rendered to, or commodities consumed by, the members of the nation, together with the addition for savings . . . in such a total are included the services of an agricultural labourer at £3 per month, and of a physician at the same price for a short visit." Sir J. C. Stamp has reconciled the differences of view, and shown that this method of computing wealth tends to exaggerate the money value of the real services rendered to the wealthy. If Professor Marshall's definition of national income (*Principles*, p. 136; see p. 79, 5th ed.) be admitted, that "Everything that is produced in the course of a year, every service rendered, every fresh utility brought about, is a part of the national income," then this income must be composed of the aggregate of all individual incomes in the general sense above described; but serious difficulties arise in the omission of the value of household services by wives, since the total national income may be made to vary by the mere redistribution of such services to paid helpers, where the wives instead of performing household duties have outside employment. The drawbacks of excluding certain degrees of mutual service from the conception of income are brought out in the reports of the Royal Commission on the Income Tax, 1920.

B. M.; J. C. S.

INDEX NUMBERS.* Following is a notice of contributions to the subject which have been made since the above article was written.

A useful review of methods is contained in the Memorandum by Mr. Fountain appended to the Report on Wholesale and Retail Prices, 1903 (House of Commons, No. 321). The principles there laid down were embodied in the Board of Trade index numbers, a series annually published in the January number of the *Labour Gazette* (down to 1920). These index numbers were obtained from wholesale prices weighted according to the national consumption during the period of 1881-90. The basic date, corresponding to the index number 100, was at first 1871; but was changed in 1906 to 1900.

Another statement of fundamental theory destined to support useful construction is found in the article on "Modes of Constructing Index Numbers," by Mr. Flux, in the *Quarterly Journal of Economics*, 1907. The theory explained there underlies the new index number constructed by the Board of Trade. This is described by Mr. Flux in the *Journal of the Royal Statistical Society* for March 1921. He recognises the distinction between two objectives, "the change in the money-cost of the things we pay due to price-changes," and "the average change in the value of money relative to other things" (*loc. cit.* p. 175). For the first the ideal form is the weighted Arithmetic Mean. The second objective is less definite. It does not imply a particular form of average. Accordingly, it is proposed to employ the Geometric Mean for the new index number. The simple geometrical mean of the price-ratios will be taken; but the principle of weighting will be introduced by grouping several species of an important genus, *e.g.* different varieties of wheat. There will be 150 price quotations, divided into eight groups of approximately equal importance. The "hampering effects" of using a fixed date as base will be avoided by

the use of the year-by-year comparison, known as the "chain method."

A useful construction on more familiar lines has lately been initiated by *The Times*. As described in the issue of 1st June 1920, this index number is based on forty leading prices, twenty relating to food-stuffs and twenty to materials. The more widely used commodities are represented by two or more prices, so as to exercise an influence corresponding to their importance. The index number is the simple (arithmetical) average of percentages, each of which is obtained by comparing the price of a commodity on the last day of each month with what it was on the 31st December 1913. Two alterations of this scheme are announced in *The Times* for 1st June 1921. The number of prices is increased from forty to sixty, and the whole of 1913 instead of 31st December of that year is taken as the base-period.

Much recent work has been directed to the measurement of the Cost of Living. The *Labour Gazette* has for several years published index numbers for the cost of food. More recently, account has been taken of other items, viz. (2) rent, (3) clothing, (4) fuel and light, and (5) miscellaneous, as explained in the *Labour Gazette* for February 1921. The average percentage increases under each of these main groups of expenditure are combined, in accordance with their estimated relative importance in average pre-war working-class expenditure. The value of the figure thus obtained is somewhat impaired by the circumstance that during the war there were considerable changes in the amounts of different commodities used by the average consumer. Professor Bowley has dealt with this difficulty in a paper read to the Royal Statistical Society, May 1919, referring to the recent reports of committees on the Cost of Living. Compare his article in the *Economic Journal* for March 1920, where for the purpose of securing that the (subjective) quantity, the "satisfaction" of the consumer, should be kept constant, an appeal to the judgment of "representative working-class women" is suggested. Professor Bowley's views are illustrated by contrast with Mr. Knibbs' treatment of the subject in an Appendix to Report No. 9 of the Labour and Industrial Branch of the Commonwealth Bureau of Census and Statistics. The measurement of changes in the cost of living is treated mathematically by Mr. T. L. Bennet in the *Journal of the Royal Statistical Society* for May 1920.

Two interesting varieties of index number are presented in the *Statist* of 19th February 1921: one based on the foreign exchanges, showing the change from month to month in the value of the £ sterling compared with twenty-eight foreign currencies; the other formed by combining the changes in the price-level for each of six leading countries since 1913.

Alongside these new index numbers the old ones mentioned in the first editions of the *Dictionary* still flourish. But one of them, that of the *Economist*, suffered a change in 1911. In order to take account of articles which had risen into importance since the second was started (in 1864), such as *rubber* and *petroleum*, the number of items was increased from twenty-two to forty-four. Also, instead of the period 1845-50 as base, the year 1900 was adopted. The rationale of the change is explained in the *Economist* for 14th February 1911. In the issue for 26th August of that year there is a useful retrospect of changes in the level of prices as shown by the index numbers since 1864. The form of the Sauerbeck index numbers remains unchanged. But the task of compiling them, ably discharged by Mr. Sauerbeck since 1886, was relinquished by him in 1913. He was succeeded by Sir George Paish, the editor of the *Statist*, in which journal the index numbers are published monthly.

Further particulars about the pre-war British index numbers may be found in the important treatise on *Index Numbers of Wholesale Prices*, by Professor Wesley Mitchell, published by the United States Bureau of Statistics, 1915. It includes, too, an account of the leading index numbers for the measurement of changes in general prices in the principal countries of the world.

Professor Mitchell's treatise also contains a comprehensive discussion of the theory underlying the construction of index numbers. An appreciation of his contribution to the subject is offered by the present writer in the June number of the *Economic Journal* for 1918. That study may serve to illustrate some of the statements contained in the preceding paragraphs. Thus at p. 188 (*Economic Journal*, vol. xxviii.) there is emphasised the distinction between the "money value of a definite set of articles" and the more indefinite kind of index number. At pp. 178-180 is exhibited the variety of conceptions which underlie the common term "index number." It is shown (p. 197 *et ante*) that the less definite conceptions, such as "the general trend of prices," do not postulate the use of a particular kind of average. Some remarks on the "chain method" (p. 185) have been endorsed by Professor Pigou in his important discussion of index numbers for the measurement of price-variations (*Economics of Welfare*, pt. i. ch. xi.).

In recent years importance has become attached to index numbers in a wider sense than as above used: to measure by way of averaging observations the growth of some otherwise indefinite economic quantity (compare the definition of "Index Number" in Bowley's *Elements of Statistics*). One of the

earliest and best examples is Giffen's computation of the change in the *volume of trade* in the later 'seventies and earlier 'eighties, as compared with a prior epoch (*Parliamentary Papers*, 1878-79, C. 2247; 1880, C. 2484; 1881, C. 3079; 1884-85, C. 4456). An appreciation of Giffen's methods and of Bourne's kindred work was offered by the present writer in the third of his memoranda on the change in the value of money (*Report of the British Association*, 1889, section iii. of Memorandum). Several examples of such calculations occur in the *Journal of the Royal Statistical Society*; in particular, the measurement of the increase in consumption of the working-classes by Mr. George Wood (1899), M. Julin's paper on the progress of Belgium (1911), Mr. Shirras' construction of an index number representing the growth of business in India (1920, p. 589 *et seq.* Compare remarks by Mr. Flux, p. 617). The construction of such index numbers has been explained by Professor Mortara in the *Giornale degl' Economisti* (referred to in the *Economic Journal*, 1913, p. 474, and 1914, p. 351), and more fully in his *Lezioni di statistica economica* (Rome, 1920), under the heading "Statistical Symptoms of Economic Conditions." Attention should also be called to De Foville's proposal for the use of different shades of colour to denote different degrees of prosperity or progress (*Journal de la Société de Statistique de Paris*, 1888). In a later writing, "Météorologie économique et sociale" (*L'Économiste Française*, 18th March and 1st April 1911), De Foville criticises unfavourably the use of *numerical* averages for the purpose; sprinkling persiflage after his wont on the application of mathematical conceptions to social phenomena. F. Y. E.

INGRAM, Dr. John Kells (1824-1907), was an economist of considerable ability, with a wide knowledge of many collateral subjects. The first work which brought him into notice was his vigorous poem on the disturbed state of Ireland at the close of the 18th century. On being asked in 1892 as to how far the sentiments of his poem, "Who fears to speak of Ninety-eight?" represented his later views, Dr. Ingram answered, "You will not suppose that the effusion of the youth exactly represents the convictions of the man. But I have never been ashamed of having written the verses. They were the fruit of genuine feeling" (*Times*, May 4, 1907). He was for many years senior Fellow and Vice-Provost of Trinity College, Dublin, where at seventeen he had been elected a scholar and later won a fellowship. In 1878 he was President of the Statistical Section of the British Association, having filled the office of president of the Statistical Society of Ireland. This *Dictionary* was largely indebted to him for many notices of foreign economists, on which his intimate study of modern literature, both English and foreign, enabled him to work with great skill and freedom. It was in the same spirit that he wrote his principal work, *A History of Political Economy*, published in 1888, founded on his article in the 9th edition of the *Encyclopædia Britannica*. The object with which this history is written is sufficiently explained in the following extract from the preparatory note to the volume, as being "rather to exhibit the historic development of economic thought in its relations with general philosophic ideas, than to give an exhaustive account of economic literature. An attempt has, however, been made, so far as was consistent with the main design, to notice all the really important works on the science." Commencing with Plato and Aristotle, and including Pliny and Cicero, the volume embraces an enormous amount of valuable information. The influence of Thomas Aquinas and the canonists is described. The mercantile system, Petty and Locke, Turgot, the Physiocrats, Adam Smith, J. S. Mill, Cairnes, down to Henry Sidgwick, Bagehot, Cliffe Leslie, and Jevons, all received notice, with remarks on the course which the study has taken both in England and the principal countries of Europe. The masterly knowledge of the subject which the book displays causes only regret that the writer did not carry his labours further. The manner in which the volume is put together, presenting as it does a mere outline where a detailed work was necessary, prevents the volume from exercising the influence on the general reader which it ought to possess. The student will find in it a mine of learning which he will do well to explore.

INSURANCE (UNEMPLOYMENT).* Unemployment insurance differs from the mere setting aside of funds for the relief of unemployment, in that the former is based on some actuarial calculation of the risk, and the adjustment thereto of rates of contribution. The method adopted in the early schemes, of which the Ghent system was typical, was the payment from municipal and other local sources of a subsidy to those organisations of workpeople which paid benefit during unemployment to their own members; the subsidy being a proportion, not greater than 100 per cent, of the benefits, with limitations on the daily amount and duration of the benefit receivable by any member. This is the "trade association" principle of subsidy, but it scarcely amounts to insurance. A proper system of insurance requires data as to the incidence of the risk over a long time, and on more than a local basis. Such data have been generally lacking, and can in fact only be supplied by the operation in expert hands over at least a full trade cycle of a scheme which would at first have to be provisional, and guarded by a safety margin. This has been the case in England, where at least an *index* of unemployment, based on

trade union returns, has been available for a considerable period, and a guarded calculation of *volume* has been possible as a starting-point for the Act of 1920.

The risk to be insured is that of "involuntary idleness." There must therefore be an adequate test of inability to find work, so that some system of notification of vacancies against applications for benefit is essential. Trade unions can to some extent supply this, and the earlier schemes naturally arose in connection with them. More general schemes imply an organised system of labour exchanges (*q.v.*) to which, for perfect working, employers would have to be compelled to notify their vacancies. Voluntary notification opens the way to leakage from the fund, unless the benefit is not great enough to tempt malingering. The problem of adequate benefit is thus associated with the difficulty of putting compulsion on employers. Again, inability to find work does not refer to any work which the applicant is capable of doing; to protect the standard of life, it must be work equal in status and remuneration to that for which he has been trained. Thirdly, "inability" rules out cases where the applicant has voluntarily or culpably lost his previous work, or has come out on strike. But in England unemployment due to a strike in another trade is insured, or at any rate the insurance fund is made liable for it (since it may be doubted if this is really insurable); while the early continental schemes barred this form of unemployment from benefit.

While insurance is mainly a form of relief, it is obvious that an effective system is in some measure preventive of unemployment, since it evens out the purchasing power of the community, and hinders the infectious spread of trade depression whereby unemployment, by lessening purchasing power, begets more unemployment. Further, if the method of levying contributions is such as to create inducements to regulate industry, there is a wider opening for its preventive application; so that the tendency of any method to create responsibility is a valuable test of its efficiency.

All insurance implies that the fortunate must pay for the unfortunate, and the method adopted therefore depends on the extent to which there is a real feeling of solidarity among the insured persons. On this ground mainly, the Poor Law Commissioners of 1909 were inclined to favour the application to England of some modification of the Ghent principle. They accepted the view that "the principle of solidarity cannot be successfully carried beyond the point up to which it is supported by the sentiment of solidarity," and therefore doubted the possibility of general insurance. On the other hand the Ghent principle, besides being limited in its operation, subsidises on the whole those who are fortunate as regards organisation and wage-rates, and subsidises them in proportion to their good fortune. Largely because of the rapid growth in the last decade of general working-class solidarity, the foreseen difficulties of a general scheme have not materialised; though it has been qualified in the British Act, as seen below, by a concession to the industries which are most fortunate to contract themselves out. It has also been found possible, under a general compulsory scheme, to make special allowance for voluntaryism and trade solidarity by allowing the trade unions which pay benefit of their own—now including about three million workers—to administer the benefits themselves, and reclaim the public benefit from the state. The Washington Conference of 1919 was divided in opinion between the two principles, and made them alternative in its recommendation.

The labour market is known to have a substratum of persons whose unemployment is chronic, and for whom a special remedy was suggested by Mr. Booth and the Poor Law Commissioners. A clear view of the insurable part of unemployment depends on these other sides of the problem being dealt with by the appropriate method, generally called training and maintenance. This has not yet been taken in hand, so that general insurance must be protected by limitations of benefit to so many weeks per annum (now twenty-six in England) or a proportion of contributions paid (now one to six in England).

Assuming that a general scheme is the most desirable, it remains to consider the method on which it should be based. The test should at least have reference to the degree to which responsibility is created. Three methods may then be reviewed. In the first place, unemployment may be placed on the general taxation of the country, no direct levy being made on insured persons or their employers. This has been called "free" insurance. It has the merit of simplicity, in that it sweeps away the machinery of stamps; and the incidence of the burden would not be inequitable. It would, however, be liable to diverge from the principle of insurance, and become simply a provision for unemployment; and this *might* lessen the efficiency of its administration. Further, if preventive work is to be considered, it is the system which gives least inducement to do it. On both these grounds, the liability of the state might be increased beyond the amount of any other economies effected.

The second proposal is to put insurance on each industry for itself. This idea has grown rapidly in the last decade, under the influence of the "guild" and other suggestions for industrial self-government. There has been some criticism of the 1920 Act on the ground that it cuts across this principle. But, prior to the Act, industries which were free to apply

this method had not done so, but had left it to the trade unions. The claims are (1) that each industry is best acquainted with its own problems, and can deal with them better than public officials can; (2) that industrial insurance gives the strongest motive to reduce unemployment by better organisation. So far as the proposals are definite, the State would not stand aside entirely, but in some cases at least would pay subsidies, while it would exercise control over statistics, and supply labour exchanges.

In considering this as a single scheme, the following points are to be noted. First, that some body of representatives from each side will be required to administer it for each industry, these representatives being able to speak for and bind their organisations. At the present time, about one-half of the field of industry in England is unorganised. This difficulty may pass away, but it is considerable. For the less organised trades, the extension of trade boards may afford some solution; but these are not voluntary bodies, and their authority might not be sufficient to maintain an imposed system of rates, appeals, and so on. Second, the burden of unemployment in any industry is largely due to causes arising outside that industry, and all industries mutually affect each other in its creation. But the incidence is widely different, the variation in England being between one per cent (in mines and railways) and ten per cent (in engineering and shipbuilding). Self-insurance by industries will not merely sectionalise the problem for administration, but will, as compared with a general scheme, re-allot it; and very heavy subsidies will be necessary in case of the least fortunate industries, which are large industries mainly composed of men. In other words, it is necessary to consider how far industrial insurance might only enable fortunate industries to escape their due share of a burden they may take a large part in creating. Thirdly, there is a serious problem of definition, in view of the great interconnection of industries, and the movement of common types of labour. Generally, it may be said that three factors enter into the question—rate of wages, rate of unemployment, and degree of organisation—and these fall together very differently.

The third plan is the insurance of the individual, apart from his industry, on a completely mutual plan. This is the basis of the British Act of 1920, which is developed out of earlier Acts of 1911 and 1916, and is compulsory, but excludes agricultural labour and domestic service. It insures at a flat rate of contribution and benefit, but different for men and women. But while based on the mutual idea, it makes concessions to the industrial idea (1) in allowing contracting out to any industry, which must then accept a reduced subsidy from the State; (2) in allowing any industry, while remaining on the general scheme up to the standard contribution and benefit, to form a supplementary scheme on its own account, to which legal force will be given; (3) in allowing associations of insured persons to operate the scheme for themselves, and reclaim the State benefit—these are mainly trade unions, but friendly societies are not excluded. Industries which contract out must satisfy the Minister of Labour that they have an adequate organisation as to notification, appeals, etc.

This, by far the largest scheme of its kind, is therefore a compromise between two ideas, necessitated by the existing facts of industrial organisation. The actuarial rate of unemployment is so taken that, if the most fortunate industries do contract out, the system is not weakened, but it is strengthened if they stay in; one-third of the insured being expected (actuarially) to take advantage of contracting out. The general rate of unemployment was estimated at 4·1 per cent, which was guarded (in view of guesswork) by a margin of 10 per cent in a number of cases, raising it to 4·3, increased to 5·3 to allow of contracting out. Twelve million people are insured, men receiving 20s. a week of benefit. As has been said, the difficulty of high benefit is that notification of vacancies by employers is not compulsory.

A compromise is necessarily open to criticism, but the Act is in principle established. Flat rates may in time give way to a percentage on wages. The contracting-out clause is only likely to be used by industries with low rates of unemployment, in which there is least scope for preventive work. Another method of making allowance for industrial responsibility on the basis of a general scheme would be to limit contracting out to industries with *more* than average unemployment, obtaining subsidies for this purpose by the excess of contributions over benefits for the low-rate industries. This might give greater scope for making insurance an instrument of prevention, an obvious condition being that the subsidy is not so great as to make prevention indifferent. It is also a matter for consideration whether overtime should not pay special contributions to such insurance schemes.

(K). — Schloss, *Insurance against Unemployment*, 1909, gives a bibliography.—*Report of the Government Actuary*, Cmd. 498 of 1919.—*Report of the Committee on Unemployment Exchanges*, 1920, Cmd. 1054.]

D. H. M.

INTERNATIONAL LAW.* Since the original article was written many developments have taken place. It is impossible to do more here than allude to a few of the most

important of them. The acquisition of territorial rights smaller than those of complete and exclusive sovereignty has ceased to be exceptional. Great Britain shares with Egypt a *condominium* in the Soudan. Several Powers have leased territory from China. A large number of Protectorates over districts inhabited by barbarous or semi-barbarous tribes have come into existence; and even such nebulous entities as Spheres of Influence have been created in abundance.

Owing to the war, yet another class of territories has sprung into existence. Germany having lost her colonies, and Turkey a large part of her empire, a number of territories have ceased to be under the sovereignty of the States to which they formerly belonged. By Art. 22 of the Covenant of the League of Nations such territories are to be placed under the guardianship of the League, which is to give a mandate to such member-States of the League as "by reason of their resources, experience, or their geographical position are best fitted to administer them." Mandates with varying degrees of power have already been granted to Great Britain, France, Belgium, South Africa, New Zealand, and Japan.

Laws of War at Sea.—During the late war British Prize Courts met the new conditions caused by the introduction of steamships, railways, cables, and wireless telegraphy, submarines and mines, not by purporting to make new law, but by developing the principles laid down by Lord Stowell and accepted and in some cases extended by the Prize Courts of at least two great maritime powers, the United States and Japan.

The principle enunciated by Lord Stowell in the *Maria*, 1 C. Rob. 350, and accepted by all maritime powers, that Prize Courts administer international law, was denied by the Hamburg Prize Court in the *Zaanstroom* (1917). The German Prize Court declared that Prize Courts are national tribunals, that they are bound to obey the orders of their Sovereign, and that international law is nothing to them if inconsistent with such orders.

Whether a British Prize Court was bound by orders in council had been left in some doubt by Lord Stowell in the *Fox*. The Privy Council emphatically decided in the *Zamora* (1916), 2 A.C. 77, that a Prize Court is bound by the legislative enactments of its own State, that it administered international law, and that it was not bound to obey the instructions of the Executive if these were inconsistent with international law.

Upon the question of the right of enemy subjects to appear in the Prize Court to defend their interests, the position is reversed. German Prize Courts allowed enemy subjects to appear in all cases. But British Courts only departed from their former practice of refusing appearance by allowing them to appear in those cases only in which they could claim to do so under the provisions of the Hague Convention. (See the *Möwe* (1915), P. 1.)

Upon the outbreak of war, Great Britain, in conjunction with France and Russia, announced her intention to direct her naval operations in conformity with the provisions of the Declaration of London, 1909, so far as might be practicable. Germany also adopted the Declaration in the same terms, and her course of action was followed in due course by Japan, Italy, and other powers. The Declaration had not been ratified by any of its signatories. These provisions were in the main merely declaratory of existing law, but they contained some far-reaching innovations.

For the first time agreement had been reached as to what should be deemed absolute contraband, conditional contraband, and non-contraband. All commodities were specified under one of these three heads. Absolute contraband included all articles which "smelt of war." Conditional contraband, all articles *ancipitis usus*, *i.e.* susceptible of use in war as well as in peace. Non-contraband, all articles not susceptible of use in war. This was known as the Free List. It was speedily found that adherence to these provisions was impracticable. Raw cotton, for instance, on the Free List, was especially susceptible of use in war. One by one similar articles were declared contraband until nothing remained, and by the Maritime Rights Order in Council, 1916, the Declaration of London was abrogated. A return was made to the old rule that everything likely directly or indirectly to assist the enemy in the prosecution of the war might be declared contraband. Almost every single article, therefore, from a hundred-ton gun to a lady's pair of garters, was declared contraband of war.

The so-called blockade of Germany was conducted in accordance, not with the rules of blockade, but with those of contraband. Owing to new weapons, such as mines and submarines, blockade in the old sense was impracticable. Under the old law the test for condemnation of goods as contraband was the destination of the vessel to an enemy port, or the destination of the goods to the enemy forces. A belligerent was not entitled to interfere with trade in articles of contraband carried on by neutrals between neutral ports, even if such goods eventually reached the enemy. During the American Civil War the Supreme Court of the Federal Government decided that if the ultimate destination of the goods was to the enemy, the fact that the intermediate port was neutral was immaterial. Great Britain acquiesced in this decision. By the Declaration of London, whilst this doctrine of continuous voyage was applied to absolute, it was not extended to conditional contraband, which although destined

for the enemy, if it were to be discharged in a neutral port, was not liable to seizure. But if "destined for the use of the enemy or of a government department" conditional contraband was liable to seizure. This hostile destination was presumed to exist "if the goods were consigned to enemy authorities, or to a contractor established in the enemy country, who as a matter of common knowledge supplied goods of this kind to the enemy, or if consigned to a fortified place belonging to the enemy or other place serving as a base for the armed forces of the enemy."

The progress of the war soon destroyed this distinction. All ports of belligerent countries were declared to be bases from which military forces drew their supplies, and when the import of food-stuffs and other articles of conditional contraband became difficult, the governments of those countries took powers to control and requisition all imports: so that the goods were going to the governments and consequently ceased to be conditional contraband. If the goods were destined for a German port, they were liable to seizure, because every German port was a base of supplies; if destined to reach Germany by land, because the German government would control or requisition them. German Prize Courts adopted the same course.

Early in the war neutral shippers ceased direct shipments to German ports and consigned cargoes to Scandinavian or Dutch ports. In the *Kim* (1915), P. 215, Sir Samuel Evans decided that if the ultimate destination of goods whether absolute or conditional contraband, whatever their first port of discharge might be, was to the enemy, they were liable to seizure. This was merely a development of the principle of continuous voyage adopted in the American Civil War. In that war goods were shipped to a neutral port and reshipped thence to an enemy port. In the late war in many cases the transport was partly by water and partly by land. The result was in either case precisely the same. The neutral port in each case was in fact the conduit pipe through which supplies reached the enemy.

As Sir Edward Grey said in his Note of July 23, 1915, to the United States: "Adjacent to Germany are various neutral countries which afford her convenient opportunities for carrying on her trade with foreign countries. Her own territories are covered by a network of railways and waterways, which enable her commerce to pass as conveniently through ports in such neutral countries as through her own. . . . Rotterdam is indeed the nearest outlet for some of the industrial districts of Germany."

By the Maritime Rights Order in Council, 1916, the principle of continuous voyage or ultimate destination was made applicable both in cases of contraband and of blockade.

In the practice of the Prize Courts important changes took place. Formerly a ship could only be condemned "out of her own mouth." In cases of continuous voyage or of consignment to neutral ports, the evidence of the ship's papers and of her officers would prove valueless. By the British Prize Court Rules, 1914, therefore, the captor was allowed to offer extrinsic evidence. In some cases intercepted communications between German and neutral merchants were admitted to prove that the neutral consignees were merely conduit pipes through which the particular consignments were to reach the enemy. In other cases, where the neutral consignees were *bona fide* purchasers of the goods, evidence was admitted to prove that, compared with pre-war business, such consignees were conducting an abnormal trade, from which the inference must be drawn that they were re-selling to Germany. In both cases the onus was thrown on the consignees to show that the ultimate destination was neutral. Merchants engaged in the former business were placed upon the "Black List," and those in the latter were "rationed," *i.e.* they were only allowed to import approximately their pre-war amount. Importation beyond this amount was regarded as intended for enemy consumption.

Other measures taken by the British government to stop all neutral trade with Germany can only be defended by the doctrine of reprisals. As these measures, authorised by what are known as the Reprisal Orders in Council, are not likely to become part of the Law of Nations, they need not be discussed here. One question, however, cannot be omitted, since it goes to the root of the opposing claims of belligerents and neutrals. Are measures of reprisal, however justifiable between belligerents, valid if they injure neutrals? Is the right of the neutral to trade with the enemy to take precedence of the right of the belligerent to stop such trade if he can? Westlake was the first to perceive that such rights are not absolute. "The very notion," he wrote, "of a precedence among rights supposes some standard by which to judge them, lying deeper than the so-called rights and excluding them from a really primary position." Between such conflicting claims, therefore, a working compromise, reached with reference to their justice and to the forces behind them, is the only solution.

Upon this question both the President of the Prize Court and the Privy Council followed the principles laid down by Lord Stowell in the *Lucy* (Edw. Adm. 122) and the *Fox* (Edw. Adm. 311). In the *Zamora* (1916, 2 A.C. 77) Lord Parker said that where there is just cause for retaliation, neutrals may by the law of nations be required to submit to inconveniences from the acts of a belligerent

power greater in degree than would be justified had no cause for retaliation arisen. In the *Stigstad* (1916, P. 123) Sir Samuel Evans held that the means adopted by the Reprisals Order, 1916, did not entail upon neutrals a degree of inconvenience which was unreasonable in the circumstances; and in the *Leonora* (1919, A.C. 974) he held that the Reprisals Order, 1917, was not illegal upon the broad ground that "the maritime commerce of neutrals is subject to restriction by the acts of states at war, if that commerce tends to assist the enemy, either directly in his warlike operations, or indirectly in carrying on of his own trade upon which his power of continuing the war may largely or even entirely depend." Both these decisions were upheld by the Privy Council. Whether this claim to retaliation asserted by Great Britain and France in the Napoleonic wars and denied by the United States in 1812, and by Great Britain and Germany and to some extent by France in the late war, will find a place in the Law of Nations remains to be seen. It would appear to be the only practicable solution.

These Reprisals Orders were the reply of Great Britain to Germany's blockade of the British Isles and to her initiation of unrestricted submarine warfare. Formerly the destruction of enemy merchantmen was only permissible under exceptional circumstances, and that of neutral merchantmen was absolutely prohibited. By the Declaration of London, 1909, whilst a neutral vessel might not be destroyed, yet if in fact liable to condemnation, she might be destroyed if her preservation would involve danger to the safety of the captor or to the success of the operations in which she was engaged at the time. But before the destruction of the vessel all persons on board were to be placed in safety.

These provisions were the result of a compromise between conflicting views. Germany, Russia, and the United States possessed few or no over-sea ports to which they could conduct their prizes. In the early days of the war German cruisers unable to take in their prizes for adjudication, after destroying their wireless apparatus, dismissed them. But later they used these provisions as a jumping-off ground for their conduct of submarine warfare: Under the plea of "exceptional necessity" and of the changed weapons of war, the German government attempted to defend the sinking at sight without notice of enemy and neutral merchantmen alike. The only solution of the problem is the restoration of the old rule. Under no circumstances ought a neutral merchantman to be destroyed, unless engaged in unneutral service.

The bombardment of British coast towns and pleasure resorts, in which a large number of non-combatants were killed and wounded, and much private property destroyed or damaged, was defended by the German government as perfectly legitimate upon the grounds that such places were either fortified or defended by regular troops, coast guns or volunteers, or contained military objectives, or alternatively that the attacks were legitimate acts of reprisal for similar attacks by the Allies and for the attempt to reduce the German people to starvation by their alleged unlawful restraint upon trade with Germany.

In none of these attacks was any notice given by the German commanders as required by the Hague Convention IX. The latter was not binding, but it was in the main declaratory of the existing law. Apart from notice, some of these attacks may be justified as being made with definite military objectives, but in the most serious raids the bombardments were of an indiscriminate character without any definite military objectives. The main objects were undoubtedly to terrorise the civilian population and to create the impression that the British had lost the control of the North Sea. If such bombardments are legitimate, the Hague Convention and the existing laws and customs of war may be regarded as obsolete.

From the first day of the war the Germans laid not only fixed automatic contact mines but also floating mines on the high seas and even in neutral territorial waters. Moreover, although the professed pre-war intention of the German Admiral Staff was that mining operations should be carried out solely against the armed forces of the enemy and that mines should be laid as far as possible off the main trade routes, it is now established by indisputable evidence that the principal object of the German authorities was to obstruct trade routes and to destroy such merchant shipping, enemy or neutral, as might continue to use them.

Owing to this policy of indiscriminate mining the British government was compelled to take counter measures. On October 2, 1914, therefore, a system of mine-fields was inaugurated in the North Sea on a considerable scale. But whereas no attempt was made by the German authorities to direct neutral shipping through their mine-fields, safety lanes were left by the British Admiralty through their mine-fields, with the result that not a single neutral vessel, following the instructions given by the Admiralty, was lost through mines. By way of retaliation the German government on February 4, 1915, declared all the waters surrounding the United Kingdom a war zone, which neutral vessels would use at their peril. By successive decrees in 1917 and 1918 the German "Barred Zones" were enormously extended in all directions, and neutral merchantmen entering them in violation of certain restrictions were warned that they would be destroyed without warning,

and without provision being made for the safety of their crews and passengers.

Although Germany was not bound by the Hague Convention VIII., dealing with mine-laying, she declared she would act in accordance with its terms. It is clear that these terms did not prohibit the laying of mines on the high seas, and that they were quite inadequate for ensuring the security of neutral shipping. But apart from the Convention it is equally clear that neutrals are entitled to navigate the high seas without being exposed to the danger of destruction by this means. "Barred Zones" are clearly illegal.

Of all the illegal and inhuman acts committed by the Germans and their natural ally the Turk, the sinking at sight of hospital ships was the most illegal and unspeakably inhuman. It was defended by the German government and the German press on the ground that these vessels were fraudulently used for the conveyance of troops and munitions. When challenged to produce their evidence, they were unable to do so. The short answer to these charges is that it was within the power of the German submarine commanders, as it was within their right, to visit and search these vessels. In only one instance was this right exercised, with the result that the hospital ship in question, the *Dunluce Castle*, visited on February 23, 1917, was released.

The sinking at sight of relief ships, even when provided with safe-conduct passes by the German authorities, was almost equally shameless and inexcusable. It was prompted by the same motives, viz. the destruction of all shipping, in order to force an early decision, an unjustifiable extension of the German doctrine of military necessity. Needless to say, such conduct is indefensible, and is in fact contrary to the provisions of the Geneva Convention 1864 and of the Hague Convention 1899, whereby Germany was bound, as well as by her own Prize Code.

Another unsettled question is the right to arm merchantmen. From time immemorial this right has been recognised, but with the abolition of privateering by the Declaration of Paris 1856, it has been thought by some jurists (erroneously, in my opinion) that the right of a merchantman to resist the enemy has been abandoned. With the initiation of the unrestricted submarine warfare, the Allies found it necessary to arm their merchantmen to resist illegal attacks. Holland denied the right and refused to admit armed merchantmen into her ports, whilst the United States admitted the right and gave them entry.

Under the existing law a merchantman is undoubtedly entitled to resist the enemy, and if she elects to fight, her crew, if captured, must be treated as prisoners of war. The execution of Captain Fryatt as a *franc-tireur* was indefensible. The analogy between sea and land operations put forward by the German government is historically false.

Laws of War on Land.—Many new weapons and many new methods of warfare were introduced by Germany and her allies in the conduct of land warfare. Some of these weapons and methods the Allied and Associated governments found themselves compelled to adopt by way of reprisal in order that their own troops might not be placed in an unfair and disadvantageous position. Almost every one of these weapons and methods was illegal, and the problem to be solved is whether any of them is to be regarded as legitimated by their general adoption in the recent war.

The new weapons were asphyxiating and poisonous gases, shells charged with such gases, and liquid fire. The new methods were the use and execution of hostages in a manner hitherto reprobated and of civilians as screens in military operations, the systematic and complete devastation of enemy territory, the bombardment of undefended towns, the deliberate destruction of public buildings, religious edifices, historic monuments and objects of art, the bombardment of hospitals, the detention and shooting of their personnel, and the deportation of civilian populations for forced labour in the interior of Germany or other parts of the occupied territories. The poisoning of wells is a very ancient offence, and it was defended by the German military commanders in West Africa on the ground "that water places in our country have come to be regarded as war material which is of assistance to the enemy and may therefore be destroyed or rendered useless." Water-supplies may of course be cut off from the armed forces of the enemy; but just as a belligerent may not deprive the enemy civilian population of its entire food supplies, so he may not destroy their water-supply, which is just as essential to their existence as food.

The employment of new weapons and new methods of destruction cannot be ruled out merely because they are new. The legitimate object of war is to weaken and put out of action the military forces of the enemy. But, as the Hague Conference declared, "the right of belligerents to adopt means of injuring the enemy is not unlimited." The test, therefore, must be whether they can be employed without inflicting unnecessary sufferings upon those against whom they are directed, and without rendering their death inevitable. Poison gas, therefore, which entails permanent disability, incurable disease, or an agonising and lingering death, must be condemned. So too the use of liquid fire and the introduction of noxious bacilli into food and water supplies. The

execution of hostages for acts for which they can in no circumstance be justly held responsible has been universally condemned except by modern German writers, who defend it under the plea of military necessity. Bluntschli maintained that hostages must never be put to death or subjected to other severities than those which may be lawfully inflicted upon members of the armed forces of the enemy. The use of civilian captives as screens and their deportation are utterly indefensible. The devastation of enemy territory which transgresses strictly military requirements and is motived by the spirit of revenge must be prohibited. So too the indiscriminate bombardment of towns without any definite military objective, and the deliberate attacks upon hospitals, the military advantages to be derived from which can never be commensurate with the suffering entailed. The military mind always forgets that peace is the normal state and war the abnormal, and that peoples have to live together after the war. The policy of "frightfulness," as this war has abundantly proved, does not succeed even from the military point of view.

Laws of War of the Air.—None of the provisions of the Hague Declaration relating to discharge of projectiles from balloons, or of the Convention IV., 1907, were binding on the belligerents in the late war, but Convention IV., 1899, which prohibited bombardment of undefended places, was binding, and may reasonably be held to have included aerial bombardment. In any case, indiscriminate aerial bombardment without any definite military objective must be condemned. It matters little whether a place be defended or not. A belligerent is not entitled to bombard a town on the off-chance of destroying some military objective. In the late war one hit in three hundred was considered good shooting. This means that in the case of the other 299 bombs civilian objects were hit. As a matter of fact, the destruction of any purely military object was of the rarest occurrence. By flying low tolerable certainty of aim is possible. At high altitudes this is impossible. The position of the aeroplane is precisely analogous to that of the submarine. If they cannot attain their objective without destroying civilian life and property they must not attack at all. There is no doubt whatever that German aviators deliberately in many cases and recklessly in others bombed Belgian, French, American, and British military hospitals.

Indiscriminate aerial bombardment must be prohibited, and both those who participate in it as well as its authors must be regarded as war criminals and liable to the extreme penalty.

Combatants and Non-Combatants.—One question underlying the whole sphere of the conduct of war is whether the old distinction between combatant and non-combatant is to be retained or altogether abandoned. This distinction has taken three centuries in the making, and has, on the whole, been observed by all modern military commanders. The Prussian theory of the "Nation in Arms" is well illustrated by the reply of a German officer to the Mayor of Noyon, who had denounced German malpractices. "It is not solely against the French enemy," he said, "that we make war, but also against the civil population, against France entire, against the women and children. Nothing that can be done with a view to impoverishing you—to ruin you if possible—can be a subject of reproach against our army."

As the American ambassador, Mr. J. W. Davis, declared at the Portsmouth Conference of the International Law Association, this theory must be challenged. It is but a reversion, under a pretence of changed conditions, to the most primeval savagery. "The demarcation between savagery and civilised warfare," he said, "lies in the recognition of the difference between the man-at-arms who meets his enemy sword in hand and the civilian who bears no weapon of offence. The one risks his life in threatening that of his adversary. The other does neither." To abolish the old distinction would therefore be a retrograde step, and so far from preventing war, it would stimulate the spirit of militarism. And indeed it would only embarrass military operations. If civilians were to be liable to indiscriminate slaughter, they would defend themselves by any means in their power, and that *bête noire* of high commands, the *franc-tireur*, would be multiplied indefinitely.

Superior Orders.—Another controversial doctrine is that of the plea of superior orders. Is a man who commits a war crime in obedience to the order of his superior officer guilty of any offence against the laws and customs of war? By the English common law—and the rule is the same wherever these principles prevail—obedience to superior orders constitutes no defence to a charge of crime against a soldier or a sailor. A soldier is only bound to obey the *lawful* command of his superior officer, which is defined in our Manual of Military Law as "not only a command which is not contrary to the ordinary law, but one which is justified by military law." As a subsequent provision goes on to explain, "if the command is obviously illegal, the inferior would be justified in questioning or in refusing to execute it. As, for instance, if he were ordered to fire on a peaceable and unoffending bystander. But so long as the orders of the superior are not obviously and decidedly in opposition to the law of the land or well-known and established customs of the army, they must be met with prompt, immediate, and unhesitating obedience."

In *Reg.* v. *Smith* (17 C.G.H. Rep. [1900] 561) the Court adopted this rule, and Mr. Justice Solomon added, "I think it is a safe rule to lay down that if a soldier honestly believes that he is doing his duty in obeying the commands of his superior, and if the orders are not so manifestly illegal that he must or ought to have known that they were unlawful, a private soldier would be protected by the orders of his superior officer."

In the American case of *Little* v. *Barreme* (2 Cranch, 170) Chief Justice Marshall said "it was the duty of a soldier to execute the lawful orders of his superiors, but that he was personally liable for the execution of an illegal order." And in *Mitchell* v. *Harmony* (13 How. 115) the Supreme Court repudiated the doctrine that an officer may take shelter under the plea of a superior command.

Certain acts have always been regarded as contrary to the laws and customs of war, but nowhere is there any suggestion that obedience to orders constitutes a valid defence to a charge of war crime, until the publication of Professor Oppenheim's *International Law* in 1906, in which he writes: "If members commit violations by order of their government, they are not war criminals and may not be punished by the enemy." For this doctrine there is no authority in international law. It is pure German doctrine based upon German municipal law. As a matter of fact and in practice such a doctrine has never been observed. For centuries belligerents have punished enemy persons guilty of war crimes who have fallen into their hands, regardless whether they acted under orders or not. In the late war and during the armistice the French military court, in trying German prisoners of war, in those cases where "superior orders" were pleaded, as they usually were, refused to admit the plea.

Military Necessity.—The doctrine of military necessity as expanded by German writers and practised by the German military authorities is the negation of all law. As Von Bethmann-Hollweg admitted in his defence of the invasion of Belgium on the ground of military necessity, "necessity knows no law." This doctrine was extended by Germany so as to cover almost every violation of the laws and customs of war. Such a doctrine means that each belligerent is a law unto himself. Its application could only result in anarchy and in reprisals, culminating in a competition of barbarism.

Germany deliberately adopted this doctrine, which has hitherto only been applied in exceptional circumstances, as a basis for her conduct of war. By this doctrine she antagonised the rest of the world and brought about her own downfall. In critical situations a military commander cannot always weigh too nicely the technicalities of law, and in his extremity he may commit some breach of the laws of war. If it is due to some real military necessity, he will be excused. But it must be something exceptional. Acts, therefore, based on reasons of naval and military necessity should be restricted as far as possible. Experience has shown that the sanctioning of the exception leads to the indefinite expansion of the exception, until the exception eats up the rule.

It is quite true, as Lord Coleridge said in the Mignette case (*Reg.* v. *Dudley and Stephens*, 15 Cox, C.C. 624), "that such a principle once admitted might be made the legal cloak for unbridled passion and atrocious crime." The true rule is that of an earlier German jurist, Bluntschli: "One may do in time of war whatever is required in military operations, that is to say, whatever is necessary for the attainment of the object of war, so long as it does not violate the laws of humanity and the accepted usages of civilised nations."

Sanctions.—The chief weakness of international law has lain in the absence of effective sanctions. Hitherto international law has rested for its enforcement upon the public opinion of the world, and in the last resort on war and measures short of war, such as retorsion, embargo, blockade, and the like, put into operations by the power or powers injured. The Hague Convention on the laws and customs of war on land, whilst forbidding certain acts, prescribed no penalties for their commission. But by the laws and customs of war all crimes which are analogous to ordinary crimes may be punished as such, if the offenders fall into the hands of the belligerent offended. Upon the conclusion of war, however, the jurisdiction of the military courts of a belligerent ceases, and unless it is a term of the treaty of peace that offenders shall be surrendered for trial and punishment the courts of the belligerent have no jurisdiction. It is therefore essential that penalties for violations of the laws of war should be prescribed by an international conference, and that jurisdiction for the trial of persons charged with such offences should be conferred upon a permanent international criminal court.

INTERNATIONAL LAW, PRIVATE.* The convention on Civil Procedure was ratified on 27th April 1899 by all the powers represented, viz. Austro-Hungary, Belgium, Denmark, Germany, France, Luxemburg, Netherlands, Portugal, Roumania, Russia, Spain, Sweden and Norway, Switzerland, and by Italy, subject to a reservation on a single point. The duration of the Treaty was for five years, and as no state gave notice of termination before that time, the convention, in accordance with an express provision, was extended until 27th April 1909. In the meantime, however, the convention was amended by the Fourth Hague Conference in 1904, and ratified by all the powers, including Japan, on 17th July 1905. By art. 287 of the Treaty of Peace of Versailles, 1919, it is agreed that the convention shall apply to the contracting powers with the exception of France, Portugal, and Roumania.

The other conventions were reconsidered at the Third Hague Conference in 1900, and conventions on marriage, divorce, and separation, and guardianship, were adopted and ratified by Belgium, France, Germany, Italy, Luxemburg, Netherlands, Roumania, Spain, Sweden, and Switzerland.

At the Fourth Hague Conference in 1904, in addition to the convention on Civil Procedure, conventions were adopted on the relations between husband and wife, guardianship, succession, lunatics, and bankruptcies.

The following conventions effectually became effective between some of the powers, viz. those relating to (1) the validity of marriage; (2) the effect of divorce and judicial separation; (3) the guardianship of infants; (4) the effect of marriage on the mutual rights of the spouses; and (5) the interdiction of persons of unsound mind, etc. Conventions 1, 2, and 3 were ratified by Belgium, France, Germany, Italy, Luxemburg, Netherlands, Portugal, Roumania, and Sweden. Spain ratified the third convention only. Conventions 4 and 5 were ratified in 1912 by France, Germany, Hungary, Italy, Netherlands, Portugal, and Roumania. In 1913 France withdrew from the first three conventions.

On the outbreak of war in 1914 all these conventions were dissolved as between belligerents, and none of them are renewed by articles 282-295 of the Treaty of Peace.

It should be noted that the primary object of the Hague Conferences was to determine which of several conflicting rules, each possessing the sanction of a particular state, should be applied in giving remedial relief to that particular class of cases.

The Latin-American Conferences, on the other hand, were inspired by a primary though not unlimited devotion to the endeavour to establish universal rules which should be obligatory in every state. This was considered by the delegates to the Hague Conference to be impracticable or even impossible of achievement (see UNIFORMITY OF LAWS).

DOMICILE AND NATIONALITY OF CORPORATE BODIES.—In the above article the section dealing with "domicile and nationality" fails to deal with the question of the domicile or nationality of corporate bodies. In Great Britain it must now be considered as finally established that the domicile of a corporate body is situate in the place whence it is managed and controlled. (*Daimler v. Continental Tyre Co.* (1916), 2 A.C. 307; *Exp. Muhesa Rubber Plantations* (1917), 1 K.B. 48.)

DOMICILE IN ORIENTAL COUNTRIES.—The law on this subject underwent a substantial change by the judgment of the House of Lords in the case of *Casdagli v. Casdagli* (1919), A.C. 145, in which it was held that a British subject may acquire a domicile in Egypt notwithstanding the fact that British subjects residing in that country pursuant to the capitulations remain subject to their own law and their own Consular Court.

BRITISH NATIONALITY.—The nationality of British subjects is now governed by the British Nationality and Status of Aliens Acts, 1914 and 1918.

Part II. of the act of 1914 may be adopted by the Dominion of Canada, the Commonwealth of Australia, the Dominion of New Zealand, the Union of South Africa, and Newfoundland. But no such adoption has yet taken place.

From the point of view of International Law, it is immaterial whether a person be a subject of a part of the State, *e.g.* a Dominion or a Colony, but not a subject of the Mother Country. Thus, a person naturalised in a British Dominion or a Colony is for all international purposes a British subject. But, as has been recently decided, such a person is regarded as an alien within the United Kingdom. (See *Rex v. Francis, ex parte Markwald* (1918), 1 K.B. 617; and *Markwald v. A.G.* (1920), 36 T.L.R. 197.) (See NATIONALITY.)

MARRIAGE. — The statement contained in the above article, according to which under the present law the "capacity to marry" depends entirely on the law of the domicile, must now be read subject to the qualification that in the case of a marriage celebrated in England between parties of whom one has an English domicile, an incapacity affecting the other party according to the law of his or her domicile does not invalidate the marriage. (*Ogden v. Ogden* (1908), p. 46; *Chetti v. Chetti* (1909), p. 67.)

DIVORCE. — The rule making the jurisdiction in respect of divorce dependent on the husband's domicile is now relaxed in favour of a wife who was domiciled in England at the time of her marriage petitioning against a husband domiciled in a foreign country and unable to obtain relief in the place in which her husband is domiciled, owing to the fact that a decree of nullity was obtained in that place on the husband's or his parents' petition. (*Stathatos v. Stathatos* (1913), p. 46; *de Montaigu v. Montaigu* (1913), p. 154.)

UNIFORMITY OF LAWS

LATIN-AMERICAN CONGRESSES.—The Congress of Lima, which met on 9th December 1877, was the first attempt to codify international private law by the means of a diplomatic conference, when plenipotentiaries from Argentina, Bolivia, Chili, Costa Rica, Ecuador, Peru, and Venezuela met and adopted two conventions, the one establishing uniform rules on many points of international private law, the other regulating extradition. The former, based on the principle that in matters of personal status and juridical capacity the law of nationality was to prevail, was not ratified by the signatory powers.

On 1st March 1888 delegates from Argentina, Bolivia, Chili, Peru, Brazil, Paraguay, and Uruguay met at Montevideo to devise and establish uniform rules of international private law. Eight draft treaties were approved on the following subjects: civil law, commercial law, penal law, the law of procedure, literary and artistic property, trade-marks, patents, and the exercise of the liberal professions. These treaties were subsequently ratified by Uruguay, Paraguay, Peru, and Argentina, by the end of 1894; by Ecuador in 1902; by Bolivia and Columbia in 1903. Chili refused to ratify those on penal law and civil law, and Brazil that on civil law. Guatemala in 1903 ratified those on procedure, copyright, trade-marks and patents.

All these treaties contained provisions for the adhesion of powers unrepresented at the Congress. Spain, France, Italy, and Belgium acceded to the treaty on copyright.

PAN-AMERICAN CONGRESS.—The First Congress met at Washington, 1889–90, for the consideration of the Montevideo treaties. Every American power was recommended to adhere to those on literary and artistic property, on patents and on trade-marks, and to seriously consider the others with a view to adhesion.

The Second Congress, held at Mexico in 1902, adopted a convention agreeing to the immediate and complete codification of both public and private international law by a commission of five American and two European jurists.

The Third Congress met at Rio de Janeiro in 1906, and adopted the convention of 1902, which has been ratified by fourteen powers. Two commissions were appointed, one to codify American Public International Law, the other to codify American International Private Law. A convention regulating the position of naturalised aliens was also adopted. This has been ratified by Brazil.

At the Fourth Congress, held at Buenos Aires in 1910, the two commissions presented detailed codes, which were not adopted. Conventions on patents, designs and industrial models, and the collection of private debts by governments from governments were, however, adopted. The last convention was ratified by the United States in 1914.

The Fifth Conference was summoned to meet at Santiago de Chili in 1915, but on account of the war was indefinitely postponed.

Two methods, fundamentally distinct, have been employed in the assimilation of Private International Law by these bodies, and by the delegates to the Hague Conferences. By the one it has been sought to lay down universal rules, which are the same in every state; by

the other (which acknowledges this to be impracticable or impossible of achievement) to determine which of several conflicting rules, each having the sanction of a particular state, shall be applied in giving remedial relief under the particular class of cases.

The Hague Conferences acted on the lines of the second method. The Latin-American were inspired by a primary, though not unlimited, devotion to the first.

Pan-American Financial Conferences.—The First Conference met at Washington in May 1915, and was attended by delegates from all the American Republics except Mexico and Haiti, and by leaders in industry and finance in the United States. The object of this movement was to free the Republics of the Western Hemisphere from the danger of complete dependence upon Europe for their economic development and commercial security—accentuated by the war—by laying the foundations for an effective international organisation.

The three main topics for discussion were: (1) the granting by United States bankers and business men of ample credits to Latin America and the provision of the necessary organisation and facilities; (2) the prompt establishment of adequate steamship facilities between the leading ports of the United States and South America; and (3) uniformity of laws relating to currency, bills of exchange and lading, classification of merchandise, customs regulations, consular certificates and invoices, port charges, regulations for commercial travellers, trade-marks and copyright, postal rates and charges for money orders and parcel post; and the extension of the procedure of arbitration in commercial disputes.

Resolutions upon all these topics were passed, to which Haiti subsequently adhered. Further, an International High Commission was created as a permanent organisation to devise means for adjusting and harmonising the principles and procedure of commercial law and the administrative regulations in the American Republics, and to work for the solution of legal problems in the fields of banking and public finance.

The Commission met at Buenos Aires in April 1916, and appointed a Central Executive Council. At this meeting, not only were the topics of the Financial Conference examined, but also those dealt with by the other Pan-American Conferences, and upon both alike the Commission invited the participating governments to co-operate in carrying out the proposals recommended and to ratify the conventions already agreed.

As a result of these invitations and of the activities of the Executive Council, substantial ameliorations have already been secured. For instance, a uniform statistical classification of merchandise has been adopted by many of the states; the Hague Rules of 1912 upon bills of exchange have been substantially incorporated in the Codes of Brazil, Guatemala, Nicaragua, and Venezuela; and a law based upon the Uniform Warehouse Receipts Act in the United States has been passed in Peru.

The Convention on Trade-Marks of 1910, by which the American Republics were divided into two groups, with Rio de Janeiro for the Southern group and Havana for the Northern, has been ratified by Bolivia, Brazil, Ecuador, Paraguay, and Uruguay in the former, and the United States, Costa Rica, Cuba, Dominica, Guatemala, Haiti, Honduras, Nicaragua, and Panama in the latter.

The Convention on Uniform Regulations for Commercial Travellers has been ratified by the United States, Guatemala, Panama, and Uruguay, and is awaiting ratification by Ecuador, Nicaragua, Paraguay, Salvador, and Venezuela.

The Second Financial Conference met in Washington in January 1920. By the first resolution the title of "Inter-American High Commission" was substituted for that of "International High Commission." To this body was entrusted the framing of recommendations upon the following subjects: railway transportation, uniformity of bills of lading, postal facilities and cable, telegraph and wireless communication; uniformity and relative equality in laws and regulations governing the organisation and treatment of foreign corporations; uniformity of laws on cheques; the avoidance of double taxation and the creation of an Inter-American Tribunal for commercial and financial disputes between two or more American States.

Those governments which had failed to ratify the conventions of 1910 in patents, copyrights, and trade-marks were strongly urged to do so by the Conference.

When it is realised that the aggregate population of the American Republics almost totals 200,000,000, the importance of the work of these Conferences will be recognised.

The British Empire.—Several attempts have been made to obtain uniformity of laws in various branches of law within the Empire. The Copyright Act of 1911, for instance, was intended to be an Imperial statute, but it failed to obtain Imperial operation. Experience, however, has shown that whenever the British Parliament enacts a carefully framed statute, such as the Bills of Exchange Act, legislatures within the Empire and even outside readily copy or adopt it. For instance, the Sale of Goods Act, 1893, has been adopted with only slight alterations by most of the provinces of the Dominion of Canada; by Queensland, South Australia, Tasmania, and Victoria in the Commonwealth of Australia; by British Guiana; by British Honduras; by

Gibraltar; by the Isle of Man; by Trinidad, Tobago, Jamaica, the Bahamas, and Barbados in the West Indies; and even by nineteen out of the fifty-three states of the United States of America.

Another British statute, the English Partnership Act, 1890, has also been widely adopted by many of the Canadian Provinces, as well as by other parts of the British Empire.

The British Money Lending Act, 1900, has been adopted by the Dominion of New Zealand.

The Bill drafted in 1900 by the Commissioners on Uniformity of Legislation in Canada, for general adoption, dealing with legitimation by subsequent marriage, has recently been adopted by Manitoba and Prince Edward Island, and in another form by New Brunswick and Saskatchewan.

From these instances it will be seen that this method for obtaining uniformity in legislation within the Empire is now generally regarded under existing circumstances as the most practicable.

Baldwin, *Comparison of the European and Latin-American Conferences and their Tendencies*, ch. xiii.; pt. ii. of *The Progress of Continental Law in the Nineteenth Century*, 1918.—*Amer. Journ. Intern. Law*, vol. 10, p. 130, p. 569; vol. 11, p. 772; vol. 14, p. 342.—Bewes, "The Treaties of Montevideo, 1889," *Grotius Society Transactions*, vol. vi., 1921. H. H. L. B.

INTERPOLATION. In statistics falling into a series (such as statistics of population or wages over a period of years), figures obtained by actual observation may be available at certain points only in the series; and if for any purpose the figures for intermediate points are required, they must in some manner be inferred. The process of estimating and filling in the intervening figures is spoken of as *statistical interpolation*. Thus, supposing that the census of population is taken every ten years only, we must obtain the figures for the intermediate years, if we are to have them at all, by interpolation. In a case of this kind the decennial figures will enable us to calculate the proportionate increase (or decrease) over a given period, and our process of interpolation will probably be based on the assumption that the rate of increase (or decrease) throughout the period in question has been uniform. The problem of statistical interpolation is often a complex and difficult one, and mathematical principles of a more or less elaborate character are involved.

[For further details, reference may be made to Bowley's *Elements of Statistics*, chap. x., and to Elderton's *Frequency Curves and Correlation*, pt. i.]

ITALIAN SCHOOL OF ECONOMISTS IN THE LAST TWENTY-FIVE YEARS.* The tendency of the Italian Economic School in the last quarter of a century, and that which constitutes its most marked progress with regard to the preceding period, can be easily indicated. Though Italian economists are to-day, as always, divided into two groups, the one hostile to any economic action on the part of the state, the other more or less favourable to it, there is, nevertheless, essential difference recognisable between the present and the preceding period. In the former, practical tendencies affected the most abstract theories, inasmuch as the liberal school rejected all the theories which afford direct or indirect justification for economic action on the part of the state (for example, the Ricardian theory of rent); whilst the school which favoured state action rejected all the theories which oppose economic action of the state. To-day, however, the marked preferences of Italian economists for the economic action or inaction of the state no longer dominate their doctrines, but they limit their own sphere of action to the practical. In the first period action interferes with theory, whilst in the second it is separate from it. Whereas in the first epoch there were two opposing sciences representing practical and opposing principles, at the present time only one science exists, whose exclusive object is the calm search for truth alone. The eventual disagreements among its representatives arise solely in the field of action and practice. This undoubtedly constitutes a noteworthy scientific progress.

In addition to this, it is not to be denied that the divergence between the two schools is nevertheless manifest also in the field of theory. These divergences, however, do not touch the fundamental theories of interest, wages, profit, currency, and population, which remain substantially unchanged in the opinion of all economists, but they relate rather to side issues or complex superstructures of economic research. Thus the liberal economists assert that the pyramidal distribution of the propertied classes is the result of the inherently hierarchical attitude of man, and for that reason inevitable; whilst the economists of the other extreme recognise in it the result of essential factors in the existing economic organisation, which legislation and evolution can remedy.

Here, however, one is concerned with the sociological interpretation of a statistical regularity, and not with a true and proper economic doctrine. Then, as regards the divergences existing at the outset between the two schools in the matter of method and premisses, these always tend to disappear. Indeed, whilst the liberal school had from the beginning praised the mathematical method as being the only means of bringing to light the laws of economics, its later representatives have admitted that this method has not up to the present discovered any economic truth hitherto unknown, and have considered it more correctly as one of the many instruments of economic research which does not exclude other processes of investigation. In the same way, whilst

formerly the liberal economists applying purely intellectual mathematical methods proclaimed the inter-relationship of all economic phenomena, and excluded entirely from our science the principle of causality,—on the other hand, their more cautious successors have restored to this principle the crown of economic investigation. Finally, whilst the first "supporters" of liberalism had placed *Final Utility* as the foundation of their theoretical constructions, without on the other hand coming to conclusions differing from the classic doctrines founded on the principle of cost, their successors acknowledge all that is uncertain, imprecise, and arbitrary contained in that principle; hence the impossibility of forming with it a science which is made exact.

On the contrary, whilst the first representatives of the state-intervention school had even reached the point of denying the existence of universal economic laws, and of proclaiming the existence of purely historical laws and always mutable according to the will of the legislator, their successors acknowledge at the present time the existence of universal economic laws that are unalterable even at the will of the state. And finally, whilst the first upholders of this school intend to extend the action of the state also to the sphere of circulation, supporting this with protective duties, their successors proclaim instead the entire liberty of exchange and commerce, and wish to limit state interference to the distribution of wealth.

As we know, therefore, the controversies which in the preceding period divided the Italian economists only survive to-day in the more mobile and relative sphere of practice and action, but they tend to disappear completely from the field of doctrine to give place to that theoretical fundamental unity which is the surest indication of a true and real scientific discipline.

As always, works of a general character stand out also in this period. We have indeed treatises on political economy by Gobbi, Graziani (3rd edition), Loria (2nd edition), Toniolo (2nd edition), the manuals of Barone (2nd edition), Labriola, Murray, Pareto, Supino (5th edition), Valenti (2nd edition); besides works embracing the whole of the economic doctrines, such as *L' Economia edonista*, by Leone; *Il Valore della scienza economica* and *Il Capitalismo*, by Arturo Labriola; the *Costituzione economica odierna* and the *Sintesi economica* (translated into French and English), by Achille Loria; and *L' Economia dinamica*, by Borgatta.

Still more numerous are the works relating to the single branches of our science.

In the field of production, the work of Supino on the theory of the transformation of capital should be borne in mind, as well as that of Sella on the economic transformation of landed capital; that of Jannaccone on the cost of production; of Graziadei, on capitalist production; of Montemartini, on savings; of Albertini, on the eight-hour question; and the essay of Virgili, on the agricultural problem and the social future. Coletti has written an important essay on the cattle industry in the province of Macerata; Bordiga, on production and the world corn trade; Einaudi deals in a masterly way with rural economy in Piedmont; Cassola and Emilio Cossa have written noteworthy books on industrial syndicates; Chessa and Marconcini, amply documented works on capitalist home industries; Mariotti, a book on Taylor's system; Fraccacreta, a very valuable work on the transformation of investments; and Fanno, on supply of joint-cost products.

On the subject of circulation may be mentioned the work of Ricca-Salerno on the theory of value in the history of economic doctrines and facts, in which the theories of the Austrian school are explained, partly criticised, and compared with the results of historical research. Sella has written on competition; Graziadei applies the laws of the value of monopoly to the case of nitrate of soda offered from Chili under limitation of output. Jannaccone has written an essay on controversial questions in the theory of barter; Natoli, a book on the values of monopoly, and another on the principle of value and the quantitative measure of labour; Pantaleoni has written a very important essay on political prices arbitrarily fixed by the state, without any regard to the cost of production, or to the conditions of demand and supply.

There are very many treatises on money; mention must be made of the books of Lorini on the monetary reform of Austria-Hungary, and of Russia, and on money and the principle of comparative cost; the studies on the value of money by Caronna; and the essay on the measure of the variations in the value of money, by Nitti. Sartori has published a treatise, based on exhaustive study, on the depreciation of paper money; Gustavo del Vecchio, a noteworthy treatise on the premium of gold. Dalla Volta has studied the influences of the new African gold; Berardi has an exhaustive work on money in its quantitative bearing. Flora has written clever treatises on Italian money; Giacomo Luzzatti, a work on the Great War and paper money; Loria, on monetary relations during the war.

On the subject of credit, one should specially consider the fine *Storia della circolazione in Italia* (from 1864 to 1890), and the international money market, by Camillo Supino; the very exhaustive works of Bonaldo Stringher (director of the Bank of Italy) on the various aspects of circulation; the work of Benini on the theories of circulation; the deep and original work of Fanno on banks, and the money market;

that of De Viti on the functions of the bank; and that by G. Luzzatti, *Credito capitalistico e moneta nazionale*; Maggiorino Ferraris and Frascara have published very useful criticisms on the Bank of Italy; Pantaleoni has made a deep economic examination of the failure of the Italian *crédit mobilier*. More recently, Nitti published an important book of great practical value on foreign capital in Italy; and Arturo Labriola and De Petri Tonelli, notable works on speculation.

On the question of commerce, Cognetti has written a work truly significant, *I due sistemi di politica commerciale*, in which the controversies between free trade and protection are admirably illustrated on the basis of the commercial history of Venice. Agnelli has published a work on free trade; Rabbeno, a very learned work on protection, which was honoured by an English translation. Giretti discourses on the commercial policy of Italy, a subject treated also wonderfully well by Stringher in several masterly treatises. Fontana-Russo published an excellent treatise on commercial policy, translated into French; Arias, a learned work of wide range on the *Principî di economia commerciale*; and a brilliant one on the same theme is given us by Graziani. Fanno has a first-rate work on the commercial and colonial expansion of modern countries. There is Morelli's book on the history of protection in Italy, Mazzei's on the commerce of the United States, and Avanzi's deep and theoretically perfect work on the influence of protection on agricultural progress. Cassola has written a good book on the formation of prices in commerce; Mariotti, a work on intermediation in its relationship to co-operation; Mario Alberti has written a vast work, *Verso la crisi*, and a very important study on the port of Trieste; and Supino has published the 3rd edition of his classic study on navigation treated from the economic aspect.

The writings also on the distribution of wealth are, as always, worthy of note. G. Ricca-Salerno has published an important work, *Il Salario nella storia delle dottrine e dei fatti economici*. Graziani has written a treatise on certain questions relating to the doctrine of wages; Tangorra and Siracusa, on the wage-fund; Musco, on the wage question; Loria, on the wage question and the labour movement; Prato, on protectionism and labour; Jannaccone, on the labour contract; Masé-Dari, Virgili, and Lucci, on strikes; Graziani and Lorini, noteworthy treatises on profit; Conigliani, on the profit of technical capital; and Einaudi has published a standard work on mineral royalties. Loria has written a treatise in French on house-rent, republished in the volume of his essays bearing the title *Verso la giustizia sociale*. Grilli has written a book on house-rent; and Masci has published a work on hydraulic rent, which deals very admirably with a subject hitherto unexplored. Masé-Dari and Natoli treat the question of rent of monopoly very well. Bresciani contributes eminently to the statistics of the distribution of incomes (as to several other statistical aspects of economic life). Alessio and Garelli write in elegant style of the ideas of patrimony and income; Cassola has written a very interesting little book on property, and Natoli on modern distribution. Pantaleoni, Valenti, Veca, Goria, Lorenzoni, Virgili, Fenicia, have very noteworthy writings on co-operation; whilst Gobbi and Rocca deal with insurance in a very skilful manner; and Montemartini with the question of the municipalisation of public services (2nd edition, Spanish translation).

The subject of landed property is dealt with in the book by Luigi Luzzatti on the safeguarding of small holders, a work rich in information and valuable observations; then come the renowned writings on agricultural policy by Valenti; the masterly work of Di Muro on landed improvements, that of Bordiga on the improvement of land and internal colonisation; that of Giglioli on the bad state of agriculture and food products; and that of Cencelli on collective property.

In dealing with population, one should bear in mind Martello's book, *L' Economia politica antimalthusiana ed il socialismo*; the essay of Loria on *Malthus* (3rd edition, English translation). On the question of unemployment, there are, besides the great work of Florian and Cavaglieri (*I Vagabondi*), noteworthy writings by Marchetti and Agnelli. Matteotti has published a book on insurance against unemployment; C. Ferraris, on unemployment and workmen's insurance. On emigration, Scalise's book should be noted, *L' Emigrazione nella Calabria*; that of Nitti on Italian emigration and its adversaries; then *Gli Italiani in Germania* by Pertile, and, above all, the praiseworthy work by Coletti on Italian emigration from 1860 to 1910, published in the Collection in memory of the fiftieth anniversary of National Unity. On colonisation there is the work of Mondaini on the United States, that of Leone on colonial expansion, and those of Porri and of Pallottino on the colonies.

In the sphere of social economy, the very numerous writings on historical materialism stand out foremost. In this relation are to be remembered, besides the 4th edition of the *Basi economiche della costituzione sociale*, by Loria (5th English edition), the *Materialismo storico e lo Stato*, by C. F. Ferraris, and the books by Mellusi, Contento, Antonio Labriola, Croce, Molteni, Moiraghi, Carmelo Scalia, on the same subject.

There are swarms of writings for and against Socialism; Enrico Ferri published an eloquent work, *Socialismo e scienza positiva*, in which

he strives to show that the theories of Darwin and Spencer lead by a logical conclusion to Socialism. It is known that Spencer protested against this application of his theories, which certainly may appear at first sight somewhat strange to those who know the chief liberal predilections and exaggerations of the great philosopher. Socialism has even been defended against its adversaries by Zerboglio (*Il Socialismo e le obbiezioni più comuni*) and Scarabelli (*Il Socialismo e la superstizione borghese*); whilst bitter attacks have been made against Socialism by a magistrate, Garofalo (*La Superstizione socialista*); by a retired prefect, Fiorentini, *Socialismo ed anarchia* and *La Marcia del socialismo*; and a senator and councillor of state, Boccardo, *Socialismo sistematico e socialisti inconscienti.* A peaceful discussion of the scientific and moral value of Socialism is found in the work of Seletti—*Whether Socialism has Scientific Foundations*, and in that of Chiappelli, *Il Socialismo e il pensiero moderno*; whilst Gori's work is a study of the dawn of Socialism (*Gli Albori del socialismo*), and the theories of revisionary Socialism are very well illustrated by Bonomi, *Le Vie nuove del socialismo.* The views on syndicalism, opportunely made clear by Arthur Labriola in the book on contemporary Socialism, are triumphantly criticised by Lucci, *Il Crepuscolo del socialismo.* Rignano, in his book on Socialism in agreement with the liberal economic theories, defends a kind of death-duty Socialism, supporting a progressive tax on those portions of hereditary possessions accumulated by ancestors progressively more distant.

Excellent contributions have been made on the economic history of ancient times by Ciccotti, *Sul tramonto della schiavitù nel mondo antico*; Mauri, *I Cittadini lavoratori dell' Attica nei secoli V e IV a. C.*; by Salvioli, *Le Capitalisme dans le monde antique.* On pre-modern history, in addition to the writings of Salvemini, Rodolico, and Volpe on Tuscany, one must remember Arias, *La Costituzione economica e sociale italiana nella età dei comuni*; Scherma, *Delle maestranze in Sicilia*; Sitta, *Le Università delle arti a Ferrara nel secolo XV al XVIII*; Lizier, *L' Economia rurale dell' età prenormanna*; Picarolo, *Abolizione della servitù della gleba nel Vercellese*; Pugliese, *Due Secoli di vita agricola; produzione e valore dei terreni, contratti agrarj, salarj e prezzi nel Vercellese nei secoli XVIII e XIX*; and Prato, *La Vita economica in Piemonte a mezzo il secolo XVIII*; *problemi monetarj e bancarj nei secoli XVII e XVIII.* Cassuto's book, too, has considerable economic information on the Jews in the period of the Renaissance.

For the present economic conditions, we have the book by Bodio on the *Indici misuratori del movimento economico italiano*; the works of Pantaleoni, Nitti, Coletti, Gini on the statistics of Italian wealth; of Colaiannù, *In Sicilia, Le condizioni della Sicilia*; Brucoleri's *La Sicilia d' oggi*; the *Capitanata triste*, by Lo Re; *I Saggi economici e statistici sulle classi popolari*, by Roberto Michels; those of Dalla Volta on England, and the important volume by the same author, *Questioni di ieri e di domani*; the remarkable inquiry into the agricultural conditions of the south, which collects valuable and trustworthy reports of able writers; and the precious yearly reports of R. Bachi on economic Italy.

Nor is there any lack of writers who have dedicated their study to the examination of the Italian economists of other days. In this connection one must remember the book of Abele Morena on the famous hydraulic expert, writer, economist, and minister, Vittorio Fossombroni; and that by Gennaro Mondaini on Fabbroni, that of Massa on Briganti, that of Giovannini on Carlo Cattaneo, of Noaro on Davanzati, of Masé-Dari on Muratori, and of Valenti on Romagnosi; and the work of Prato on the agricultural association of Piedmont in 1848.

Economic research is greatly promoted by several leading reviews. We may mention the *Riforma sociale*, begun in 1894, which contains many valuable articles on theoretical and practical economy, and further, *L' Economista*, *L' Economista dell' Italia moderna*, the *Corriere economico*, the *Economia italiana*, the *Rinovamento economico*, all of which prove the great zeal with which the study of economics is cultivated in Italy. ACH. L.

PRINCIPAL WORKS.

Arias, *Principî di economia commerciale*, Milan, 1917.—Barone, *Principî di economia politica*, Rome, 1908-9.—Berardi, *La Moneta nei suoi rapporti quantitativi*, Turin, 1912.—Einaudi, *La Rendita mineraria*, Turin, 1901.—Cassola, *I Sindicati industriali*, Bari, 1905.—Goria, *La Cooperazione di classe fra i lavoratori in Italia*, Turin, 1909.—Fanno, *L' Espansione commerciale e coloniale degli stati moderni*, Turin, 1906; *Le Banche e il mercato monetario*, Rome, 1913.—Graziani, *Studî sulla teoria dell' interesse*, Torino, 1898; *Istituzioni di economia politica*, 3rd edition, Turin, 1917; *Principî di economia commerciale*, Naples, 1913.—Gobbi, *Trattato di economia*, Milan, 1919.—Jannaccone, *Il Costo di produzione*, Turin, 1901.—Loria, *Le Basi economiche della costruzione sociale* (4th edit., Italian, Turin, 1912, 5th edit., English, London, 1920); *La Costituzione economica odierna*, Turin, 1898; *La Sintesi economica*, Turin, 1909 (French translation, 1911, English translation, 1913); *Verso la giustizia sociale*, Milan, 3rd edition, 1920; *Corso di economia politica*, edited by Fenoglio, 2nd edition, Turin, 1919.—Masci, *La Rendita idraulica*, Milan, 1914.—Pantaleoni, *Scritti varî di economia*, Rome, 1904 and following.—Pareto, *Manuale di*

economia politica, Milan, 1906 (French translation).—Ricca Salerno, *Il Valore nella storia delle dottrine e dei fatti economici*, Rome, 1904; *Il Salario nella storia delle dottrine e dei fatti economici*, Palermo, 1900.—Prato, *Il Protezionismo operaio*, Torino, 1910.—Supino, *La Navigazione dal punto di vista economico*, 3rd edition, Milan, 1913; *Il Mercato, monetario internazionale*, Milan, 1910.—Toniolo, *Trattato di economia sociale*, Florence, 2nd edition, 1915.—Valenti, *Principi di scienza economica*, Florence, 2nd edition, 1918.

JUGLAR, Clément (1824-1905). A physician by profession, he took an early interest in economic problems, for he was elected in 1852 a member of the *Société d'économie politique* of Paris; still, the researches into the origin and development of commercial and financial crises, by which he made himself known, were only initiated a quarter of a century later.

He began by expressing his views in numerous pamphlets and reprints of articles contributed to the *Journal des économistes*, the *Économiste français*, and the *Journal de la statistique*; his only extensive work is entitled *Des crises commerciales et de leur retour périodique en France, en Angleterre at aux États-Unis* (Paris, 2 vols., 1889, with diagrams); see also his article "Crises commerciales" in Léon Say's *Nouveau Dictionnaire d'économie politique* (vol. i., 1891).

He lays great stress on the three unfailing successive periods which he discovers in every crisis: the period of growing activity, and latterly of inflation leading to a short period of *explosion*, followed by a protracted and painful period of *liquidation*, generally lasting several years. The *explosion* is sure to occur at the end of a long period of rising prices, when no *new* buyers appear on the market, and the banks are compelled to resist the drainage of their metallic reserves. Their balance sheets are thus the barometer in which can be read the approach of a crisis, and this reading, combined with the observation of the movements of prices, the rates of discount, and the foreign exchange with the fluctuations of exports and imports, makes it even possible to determine the state of affairs prevailing at the moment. It has been objected that these conclusions can only be applied to ordinary commercial or monetary crises, but are deficient when the crisis is the result of a wide change in the conditions of production. E. Ca.

KNIES, Karl (1821-1898), born at Marburg, Hesse, lectured for a short time on History and Political Economy at the University of that town and taught Political Economy at the Polytechnic School at Cassel. Later, after a brief absence from Germany owing to the political disturbances of 1848, he was appointed, 1855, Professor of Political Economy at the University of Freiburg, Baden. From 1861 to 1865 he was occupied in politics, sitting in the second Chamber of the Diet of the Grand Duchy of Baden as member for the University, his sympathies being with the liberal party. He was made President of the Board of Education in 1862. In 1865 he returned to university life as Professor of Political Economy at Heidelberg, which office he held till shortly before his death.

Knies is distinguished as the earliest and most energetic promoter of the historical method of economic science in Germany. His principal work was *Die politische Ökonomie vom Standpunkte der geschichtlichen Methode*, 1st ed. 1853, 2nd ed., much enlarged, 1883. He also wrote on mercantile questions—Money, Capital, Credit, Value, Transport and the Means of Communication, to the literature of which subjects he made valuable additions as well as to the study of the science of statistics. His faculty of close reasoning and power of analysis were remarkable.

Besides the works mentioned above, he wrote: *Die Statistik als selbständige Wissenschaft. Zur Lösung des Wirrsals in der Theorie und Praxis dieser Wissenschaft. Zugleich ein Beitrag zu einer kritischen Geschichte der Statistik seit Achenwall*, Cassel, 1850.—*Die Dienstleistung des Soldaten und die Mängel der Konskriptionspraxis. Eine volkwirtschaftlich-finanzielle Erörterung.* Freiburg in Breisgau, 1860.—*Zur Lehre vom volkswirtschaftlichen Güterverkehr*, 1862.—*Geld und Kredit*, Berlin, 1873.—*Weltgeld und Weltmünze*, Berlin, 1874.—*Karl Friedrichs von Baden brieflicher Verkehr mit Mirabeau und Dupont.* Published by the *Badischen Historischen Kommission.* Arranged, with an Introduction giving a short history of the period preceding the first French Revolution and of the Physiocrats, by K. Knies, 2 vols., Heidelberg, 1882. He also contributed many articles to collective works and periodicals.

[See *Economic Journal*, vol. ix., London, 1899.—*Handwörterbuch der Staatswissenschaften*, giving complete list of works, vol. v., 1900.]

LABOUR EXCHANGES. Labour exchanges are the first step necessary to the organisation, for the purposes of social reform, of the labour market. They imply the creation for labour of a market, as distinguished from the search for work by individual workmen by personal inquiry at factories, or the "hawking" of labour. While the latter practice still survives to a considerable extent, even in countries where exchanges are well developed, it was always qualified by a certain amount of direction through the trade union method of "vacant" books and "call" offices, located at offices of the unions, public-houses, and clubs, or the house of an official. The need of a better and wider system was first recognised on

the Continent, especially in Germany; in which country several systems developed together toward the end of last century, some being under the control of employers, some under the control of trade unions, some under joint control, but the most important being either municipal or supported by municipal subsidies. An account of these early developments is given in the Board of Trade Report, Cd. 2304 of 1904. In England, there had been a similar local development under an Act of 1902 and the Unemployed Workmen Act of 1905. The Poor Law Commissioners' Report of 1909 made a national system of labour exchanges the pivot of all their other recommendations for dealing with unemployment. The Labour Exchanges Act was passed in 1909, and the first exchanges were opened early in 1910. It was left to the discretion of the Minister to open exchanges as required.

A number of ideas were focussed in the policy. The most important motive arose out of the facts regarding casual labour in great cities, especially ports; for this class, the idea was *decasualisation*, *i.e.* the fitting of irregular periods of work into a continuous period for certain individual workmen, or the abolition of "half places" in industry, any surplus thereby revealed being dealt with by emigration, institutional training for other work, or absorption once for all in new industries. As a special case of this, it was hoped that seasonal occupations could to some extent be dovetailed, by the collection of information regarding temporary fluctuations. As regards higher grades of labour, fluidity would be increased and intelligently directed, thereby lessening the interval between jobs, and also enabling workmen, whether unemployed at the time or not, to find the jobs most suitable for them. Again, a system of exchanges would be the means of obtaining and centralising information regarding industrial conditions, which is essential (*a*) for the guidance of juveniles entering industry; (*b*) for the guidance of adults through unemployment due to changes in industrial structure; (*c*) for the operation of any properly guarded scheme of insurance against unemployment (*q.v.*).

While the most important foreign systems were private or municipal, a public free system was adopted in England, and this policy was endorsed by the International Labour Conference at Washington in its Draft Convention, which also proposed the co-ordination of the various national systems by the International Labour Office. The operation of such a system in England for a decade was reviewed by a special committee in 1920 (Cmd. 1054), whose Report draws attention to a number of inherent difficulties and problems. These may be briefly reviewed.

A properly efficient system of exchanges requires to be adequately *specialised*. This was a feature of the most successful exchanges in Germany—*e.g.* the Berlin Exchange—in which separate departments were given to important industries, under the supervision of their own expert officials. In England, on the other hand, the exchanges (with one exception) were general, all forms of labour being dealt with by public officials. This led to imperfect discrimination in forwarding applicants to jobs, and lessened the confidence of employers in the system. The mixture of all grades of labour at the exchanges was also an objection (largely because of craft spirit) from the workmen's side. Specialisation in England had been carried out only in regard to women and juveniles. This objection is closely allied to the problem of *staff*. A public system creates a civil service, in which opportunities for promotion largely imply movement from one exchange to another. Officials who had gained experience in the affairs of local industries lost the advantage of this by transfer, and the efficiency suffered at both ends. Greater scope for local promotion (at least in terms of pay) was therefore found essential; and, combined with this, the giving to the staff of opportunities of going round local works and acquainting themselves with the technical conditions of industries. The problem of *buildings* is also in point. Certain exchanges may be specialised to the use of particular industries — as is done with the Building Trades Exchange in London—but the extent of this method is limited by expense, if the system is to remain free; and it is to be noted that a special exchange for *unskilled* labour is a doubtful step, if exchanges are to be clearly marked off from poor law or distress organisations. It seems best that the work should be grouped in large exchanges, with departmental arrangements.

The relation of exchanges to trade unions involves some important questions. What should be the policy of public exchanges during a trade dispute? They might be closed entirely, for the industry in question, to both employers and workmen. This was the recommendation of the committee of 1920. It places on the officials a serious responsibility, especially when disputes are partial or unauthorised. The accepted practice in England and abroad has been to notify an applicant that there is a dispute, while informing him of any vacancy offered. As regards the maintenance of trade union *rates*, exchanges have not taken any responsibility (unless in the case of legal rates), though it is proposed in the report mentioned that wage agreements properly representative of the parties concerned over the whole industry might, under the review of a central authority, be enforced through the exchanges. These difficulties will become less

serious in proportion as specialised departments are organised. Trade unions have worked well with the British exchanges, about 60 per cent of "vacant books" being lodged there for signature.

Advisory bodies, called local employment committees, are attached to exchanges, and are composed equally of employers' and workpeople's representatives. A difficulty has been felt in giving them adequate responsibility, while maintaining the official control over discipline and staff. Their function is that of giving continuous attention to the problem of employment in their areas, in view of labour exchange data, with which they are supplied; the manager of the exchange usually acting as their secretary. They may advise as regards staff, acquisition of premises, publicity, and similar matters.

One of the most important functions of exchanges is in relation to juvenile employment. They are in touch with the schools and the Local Education Authority, with a view to advising children entering on and during employment. This function is performed in England *either* by a committee under the Labour Exchanges Act, called the juvenile advisory committee, of which the Education Authority has the right to nominate one-third of the members; *or* by a committee of the L.E.A., appointed under the Choice of Employment Act of 1910, which receives notification of vacancies from the exchange. This duplication has been felt to be undesirable, and frequent proposals have been made to put the work entirely under one authority.

In England there are about 400 exchanges. This number, large as compared with the public exchanges elsewhere, is explained by the needs of insurance against unemployment. In this scheme, the exchange takes the place of the doctor under health insurance. The "doctor" being now a fixed building, a wide distribution is made; and over 1000 sub-offices ramify into the smaller areas. This has considerably increased the cost of exchanges in England, estimated for a normal year at 2½ millions sterling. It follows that the number of vacancies filled per exchange has been much lower than, *e.g.*, in Germany. Only two filled over 50 places per day in 1920, while about three-fourths filled under 10 places, and 40 per cent filled under 5; while the larger and more concentrated German exchanges fill hundreds of places daily. The operation of compulsory insurance is, however, likely to increase greatly the English figures, since applicants must go to an exchange. It remains true in England, as in Germany, that most places are filled outside the exchanges, the British ratio being estimated in 1920 at not less than 3 to 1. Proposals have been made to place compulsion on employers to obtain all labour through exchanges, but this has not been found practicable; though there is an obvious danger of leakage from any unemployment insurance fund, if the benefit is great enough to tempt malingering, and the exchanges are not notified of all vacancies available.

[Beveridge, *Unemployment*, 1909; *Report on Foreign Agencies for dealing with the Unemployed*, Cd. 2304 of 1904; *Report of the Committee of Enquiry on Employment Exchanges*, Cmd. 1054 of 1920; *Reports of the Poor Law Commission*, 1909.] D. H. M.

LAWFUL HOURS.* The hours within which intoxicating liquors may be sold retail in licensed premises are now governed by the Licensing Act, 1921, and are different for the Metropolis, the Metropolitan district, towns or populous places, and elsewhere. Licensing justices have limited powers of varying the closing hours.

The hours of employment in factories and workshops are now governed by the consolidating Act of 1901, part ii. With certain exceptions no woman, young person (*i.e.* under 18), or child (*i.e.* under 14) may be employed on Sunday. In a textile factory the hours for employment of women and young persons are 6 A.M. to 6 P.M. or 7 A.M. to 7 P.M., but on Saturdays employment which begins at 6 A.M. must end at noon in manufacturing processes, otherwise at 12.30 P.M. if not less than one hour is allowed for meals. If less is allowed the closing times are 11.30 A.M. and noon respectively. Employment which begins at 7 A.M. closes at 12.30 P.M. in manufacturing processes, otherwise at 1 P.M. Meal hours are two hours except on Saturday, when half an hour is obligatory. In continuous employment for four and a half hours, half an hour meal time is obligatory. In textile factories children must only be employed every other day or either morning or afternoon, and then not more than seven days at the same hours. In non-textile factories and workshops employment for women and young persons begins at 6 A.M., 7, or 8, and ends respectively at 6 P.M., 7, and 8; Saturdays 6 A.M. to 2, 7 to 3, or 8 to 4 P.M. Meal times, one and a half hours except on Saturday, half an hour. Continuous employment for five hours requires half an hour interval for meal. Children may only be employed either morning or afternoon, but, if two hours are allowed for meals, may be employed alternate days. They may not be employed for the same time or day for more than seven days. Special provisions apply to print, bleaching, and dyeing works, and for women's workshops. The usual bank holidays or substituted days are obligatory. There are also special provisions which apply to special trades, overtime, night work, and intermittent employment. In coal mines the period for which a workman may be employed below

ground is seven hours (Act of 1919), with certain exceptions. No boy under fourteen, and no woman or girl may be employed below ground. No child under thirteen may be employed above ground. No boy, girl, or woman may be employed more than fifty-four hours in any one week, or more than ten hours in any one day, nor between 9 P.M. and 5 A.M., nor Sunday, nor after 2 P.M. Saturday, nor in such heavy work as is likely to cause them injury. Provision is made for meal time (Act of 1911). Disputes as to hours and other matters are now often dealt with under the Industrial Courts Act 1919.

In some cases hours and other working conditions are fixed either by a resolution of the Joint Industrial Council for the industry, or by formal agreement between employers' associations and trade unions, or by arbitration. In the building trades hours are to a very large extent fixed by the Area Joint Councils. In 1920 a volume [Cd. 1253] was published by the Ministry of Labour giving the standard time rates of wages and hours of labour in the United Kingdom at 31st December 1920, and the numerous changes which have since taken place have been announced in the several issues of the *Ministry of Labour Gazette*, published monthly.

Part xiii. of the Treaty of Versailles is concerned with the conditions of labour and, *inter alia*, with the regulation of hours of work, including the establishment of a maximum working day and week. It constituted the International Labour Office at Geneva, which functions to a great extent independently of the League of Nations. Its governing body is composed of 12 persons representing Governments, 6 persons elected by the General Conference of Representatives of the members at the annual meeting to represent employers, and another 6 persons to represent the workers. At the first Conference, held in Washington, 29th October to 29th November 1920, numerous draft conventions and recommendations were adopted. The first convention regulated the maximum hours in industries, as defined in article 1, excluding land transport, transport by sea and inland waterways, and agriculture, and fixed the said hours at 8 in the day and 48 in the week, special provision being made for workers in shifts who are allowed to work up to 56 hours without prejudice to the lawful rest days. Urgent work to machinery or plant, and in cases of accident and *force majeure*, is allowed in excess of the limit, and, with government sanction in exceptional cases, excess daily hours may be worked, but so as not to exceed the weekly average of 48.

Article 9 contains modifications and conditions applicable to Japan; article 10 fixes a 60-hour week for factories, mines, and certain railway work in India; in certain industries in Greece the convention is to be brought into force not later than 1st July 1923, and in certain others than 1st July 1924; in Rumania generally the convention is to be brought into operation not later than 1st July 1924; otherwise it was to come into force generally on 1st July 1921. It did not apply to China, Persia, or Siam. It was to be applied to such colonies, protectorates, and possessions as were not self-governing, where applicable with or without modifications.

The same conference adopted a draft convention on the employment in industry of young persons at night, with certain exceptions, the minimum age being for most purposes fixed at 18.

At the second session, held at Geneva, 15th June to 10th July 1920, the Conference adopted a recommendation on the limitation of hours in the fishing industry and inland navigation, and a draft convention fixing the age of employment of children at sea at the minimum of 14. At the third session, held from 25th October to 19th November 1921, the Conference adopted a convention which forbade the employment of children under 14 in agriculture, except outside school hours, and only so as not to prejudice their attendance at school; but for practical instruction light agricultural work was permitted so as not to reduce the annual period of school attendance under 8 months. It also adopted recommendations on night work of women in agriculture, on night work of children and young persons in agriculture, on weekly rests, and a convention fixing the minimum age of young persons employed as stokers or trimmers to 18, except in the coastal trade of India and Japan, and vessels not mainly propelled by steam.

Information as to the adoption of conventions, etc., is given in the *Official Bulletin*, Vol. v. No. 8, which is kept up to date.

The fourth session was summoned to meet at Geneva on 18th October 1922.

SHOP-HOURS. By chapter iii. of the Statutes of 1912, the Shops Regulation Acts, 1892 to 1911, were consolidated. By its main provisions no shop assistant can be employed on at least one day a week after half-past one. Intervals for meals were scheduled, but these do not apply if all assistants are resident members of the employer's family. No young person (*i.e.* a person under 18) can be employed more than 74 hours, including meal times, in any one week, whether at the same place or not. This applies to wholesale shops and warehouses. One seat to every female assistant must be provided.

SHOP-CLOSING. By the same Act all shops, with some exceptions, must be closed at one o'clock on at least one day in the week; but the holiday before or after a whole bank holiday may be excepted at the wish of the

employer. Provision is made for the varying incidence of closing by means of orders made by the local authority. The weekly holiday may be suspended by the local authority of a holiday resort for not more than 4 months. Special provisions apply to multiple shops and the Post Office. The Act applies to England and to Scotland and Ireland with the necessary modifications. The trades wholly exempted from the weekly holiday are: (1) retail sale of intoxicating liquors, (2) of refreshments, (3) of motor, cycle, and aircraft supplies and accessories to travellers, (4) sale of newspapers and periodicals, (5) of articles of a perishable nature, (6) tobacco and smokers' requisites, (7) railway bookstalls, (8) sale of medicines and appliances, (9) retail trade subsidiary or ancillary to an exhibition or show. The trades exempt from early closing are (1) (2) for consumption on the premises, business at a railway refreshment room, (4) (6) (7) (8) and Post Office business.

During the war other closing orders were made on certain trades under the powers conferred by the Defence of the Realm Acts. These have now lapsed. W. A. B.

LEASE.* For short tenancies it is quite usual to have what is termed an agreement for a lease, which is not under seal, and which for all practical purposes operates as if it were a lease, except that, not being under seal, the obligations expire in six years from their incidence, while covenants can be put in action within twenty years.

Since the passing of the Conveyancing and Law of Property Act, 1881, where a person is expressed to convey as "beneficial owner" the following covenants by him are implied: (1) that he is entitled to convey; (2) that the lessee shall have quiet enjoyment; (3) that there is no incumbrance; (4) that he will further assure the lessee in his lease if required. In a conveyance of leasehold property the expressed beneficial owner impliedly covenants that the lease is good. The same Act contained restrictions and relief against forfeiture of leases, and among other things obliged the lessor first to serve notice on the lessee of the breach complained of requiring him to remedy it, if of such a character, and in all cases requiring the lessee to make compensation in money. This relief did not apply to covenants or conditions against assigning, underletting, or parting with the possession of the land, but this exception is repealed by the Law of Property Act, 1922 (§ 78), which comes into force on 1st January 1925. By the latter Act a contract under seal is to bind the land as well as the person of the contractor (§ 96). W. A. B.

LEASEHOLD PROPERTY.* A further step in the enfranchisement of leaseholds was taken by the Act of 1920, c. 56, which authorises the compulsory purchase of the sites of places lawfully used for public religious worship under leases, underleases or agreements for lives or a life or for the original term of twenty-one years or more, whether determinable on a life or lives or not. A "place of worship" includes burial-grounds, Sunday or Sabbath schools, caretakers' and ministers' houses attached to or used in connection with and held upon the same trusts as a place of worship. By § 143 of the Law of Property Act, 1922, leases which are perpetually renewable are converted into leases for 2000 years. This Act comes into force on 1st January 1925.

There is still a strong movement in favour of the enfranchisement of leaseholds, it being held that a freehold is a more desirable form of property, particularly for house property in towns. Leasehold houses in the country, apart from farmhouses, are infrequent. It appears very doubtful if the enfranchisement of leasehold farms would be beneficial to the tenant, who would then be obliged to sink a large portion of his capital in the freehold, or to borrow on mortgage, leaving him often with insufficient working capital. Also, the great majority of farms are held on very short tenancies, too short for enfranchisement.

A remarkable interference with economic laws was effected by the Increase of Rent and Mortgage Interest (Restrictions) Act, 1920 (repealing previous Acts of 1915, 1918, and 1919), passed to protect tenants of small properties and mortgagees from the sudden change in values occasioned by the economic changes due to the war. In respect of business premises, the Act lapsed on 24th June 1921, but as regards dwelling-houses, it has been extended to 24th June 1923, and in a modified form may be further extended. It applies to properties of the annual value of £105 in the Metropolitan Police District (including the City of London), of £90 in Scotland, and £78 elsewhere (including Ireland). It protects tenants who have paid their rents, although their legal tenancies would otherwise have expired or been determined, both from ejectment and increase of rent beyond interest on structural improvements, the amount of increased rates over those of 3rd August 1914, plus 15 per cent on the net rent as on 4th August 1914, and 25 per cent where the landlord is responsible for the whole repairs. Furnished houses must not be let at more than 25 per cent above the normal profit from an imaginary letting ending on 3rd August 1914. The landlord may, however, recover possession if he requires it for the occupation of himself or an employee on satisfying the Court that there exists alternative accommodation available for the tenant, but this is not necessary (1) where the tenant became such as employee of the landlord; (2) where the house is required for an agricultural worker; (3) where the land-

lord gave up his occupation in consequence of his war service; and (4) where the landlord became such at times too complicated for detail.

Similar post-war legislation was passed in several other countries. W. A. B.

LEROY-BEAULIEU, Paul (1843-1916), whose father was a Prefect and Deputy under Louis Philippe, married a daughter of Michel Chevalier, and succeeded his father-in-law as Professor of Political Economy at the Collège de France in 1879. He had already founded in 1873 the *Économiste français*, which he edited with great success throughout the rest of his life. His prolific writings passed through many editions, and his reputation in public and commercial finance stood very high in French circles. His principal works are: *Recherches économiques sur les guerres contemporaines*, 1863-69; *Le Travail des femmes au XX^e siècle*, 1873; *La Colonisation chez les peuples modernes*, 1874; *Traité de la science des finances*, 1876; *Essai sur la répartition des richesses*, 1880; *Le Collectivisme*, 1884; *L'État moderne et ses fonctions*, 1889; *Traité d'économie politique*, 1895. He belonged to the traditional French school of free-trade and individualism. His writings are able and well-informed, with a strong bias in favour of individual liberty as against state regulation. In finance, also, he adopted a conservative attitude, but shows considerable power of analysis and exposition. H. H.

LEROY-BEAULIEU, Pierre (1871-1915), son of the well-known economist, Paul Leroy-Beaulieu, assisted his father in editing the *Économiste français* from 1895, and became Professor at the École libre des sciences politiques in 1903. He was a member of the Chamber of Deputies from 1906 to 1914. He was killed in action during the Great War. He wrote: *Les Nouvelles Sociétés anglo-saxonnes*, 1897; *La Rénovation de l'Asie*, 1900; *Les États-Unis au XX^e siècle*, 1904; *Les Impôts et les revenus en France, en Angleterre, et en Allemagne*, 1914. H. H.

LEXIS, Wilhelm (1837-1914), Professor of Political Economy at Strasburg 1872, Dorpat 1874, Freiburg-im-Bresgau 1876, Breslau 1884, Göttingen 1887-1912, edited with Conrad the *Jahrbuch* and *Handwörterbuch* of Political Economy and Political Science. He was responsible mainly for the sections of currency, finance, and statistics. He is best known by his investigations into the statistics of population and the ratio of the sexes: *Einleitung in die Theorie der Bevölkerungsstatistik*, 1875; *Zur Theorie der Massenerscheinung in der menschlichen Gesellschaft*, 1877; *Abhandlungen zur Theorie der Bevölkerungs- und Moralstatistik*, 1903.

LLOYD, The Rev. William Foster, F.R.S. (1794-1853), was educated at Westminster and Christchurch, Oxford, at which university he was Drummond Professor of Political Economy 1835-37. He discusses the question of utility and value. In this he anticipated "more than a generation before its rediscovery by Jevons, Menger, and Walras" the theory of marginal utility. He considers that not only can value not be intrinsic, but the utility of an object is not intrinsic any more than value. Utility, like value, is predicated of an object with reference to the wants of mankind.

With regard to value he holds "the proud position of having been the first thinker in any country to advance what is known to-day as the marginal theory of value, and to explain the dependence of value, on marginal utility."

The complete list of Lloyd's published Oxford lectures is as follows:—

Two Lectures on the Checks to Population, delivered before the University of Oxford in Michaelmas Term 1832, Oxford, 1833.—*A Lecture on the Notion of Value as distinguishable not only from Utility, but also from Value in Exchange, delivered before the University of Oxford in Michaelmas Term 1833*, Oxford, 1834.—*Four Lectures on Poor Laws, delivered before the University of Oxford in Michaelmas Term 1834*, Oxford, 1835.—*Two Lectures on Poor Laws, delivered before the University of Oxford in Hilary Term 1836*, Oxford, 1837.—*Two Lectures on the Justice of Poor Laws, and one Lecture on Rent, delivered in the University of Oxford in Michaelmas Term 1836*, Oxford, 1837.—*Lectures on Population, Value, Poor Laws, and Rent, delivered in the University of Oxford during the years 1832, 1833, 1834, 1835, and 1836*, London, 1837.

[See notice in "On some neglected British Economists," by Professor E. R. A. Seligman, *Economic Journal*, London, 1903.]

LONGFIELD,* Mountifort (1802-1884). We may quote in addition to the notice on Longfield on p. 640 from Professor Seligman's reference to his writings. "Longfield's general theory of value is noteworthy, in that he not only puts very lucidly the influence of cost of production upon the supply side of the equation between supply and demand, but calls attention to the demand side as well." He expounds "the doctrine of marginal demand. It is this marginal idea which he applies to the supply side of the schedule as well, and which results in his most characteristic contribution to economics." In his writings "we have an exposition of the theory of marginal cost, as well as that of marginal demand. It is in the theory of profits and interest that we find the application not only of the marginal idea, but of the productivity idea as well, thus combining to form the conception of marginal productivity."

Professor Seligman continues: "The discovery of the marginal productivity theory of interest is not Longfield's only claim to distinction. In his theory of wages he also marks a decided

advance." According to him, the correct theory may be summed up in the statement that "the wages of the labourer depend upon the value of his labour, and not on his wants whether natural or acquired."

Space does not allow us to quote further from Professor Seligman's remarks on Longfield; he is also mentioned by Mr. Cannan, who states in reference to his originality, that Longfield in his Dublin lectures "ignores altogether the doctrine that wages depend on the proportion between capital and population," and while considering that Longfield has not completely mastered the subject, he remarks that "his theory shows a great advance on that of James Mill, Ricardo, and M'Culloch." [See notices on these writers.] Again, in regard to profit as discussed by J. S. Mill, Cannan remarks that Longfield "had approached far nearer to a true appreciation of the causes which determine the rate of profit."

[E. R. A. Seligman, "On some neglected British Economists," *Economic Journal*, 1903. — E. Cannan, *A History of the Theories of Production and Distribution in English Political Economy from 1776 to 1848*, London, 1893.]

MACDONELL, Sir John (1846-1921), best known as a jurist and writer on international law, wrote a *Survey of Political Economy*, 1871, which shows ability and originality. He was well informed upon economic questions, and a good example of his sanity of judgment will be found in a paper contributed by him to vol. 6 of the *Proceedings of the Political Economy Club*, 1921. At the time of his death he was King's Remembrancer of the Supreme Court. Interesting obituary notices appeared in the *Economic Journal* for June 1921. H. H.

MACLEOD, Henry Dunning (1821-1902), M.A., Cambridge, and barrister (1849), writer on banking and economics, was a man of vigorous personality, with much industry and historical knowledge, but of mediocre judgment.

The whole or parts of some of Macleod's works were reissued under new titles. His most useful publication was *Dictionary of Political Economy, biographical, bibliographical, historical, and practical*, 1863, vol. i. large 8vo. A–C only appeared. In 1878 he advertised a second edition of vol. i., and stated that vol. ii. completing the work was in progress. Five editions were published of his *Theory and Practice of Banking*, 1st, 1855-56; 2nd, 1866; 3rd, 1875; 4th, 1883-86; 5th, 1892-93, 2 vols. 8vo. An Italian translation was produced in the *Biblioteca dell' Economista*, 1879.

He also wrote *The Elements of Political Economy*, 1858, 8vo. The second edition was entitled *The Principles of Economic Philosophy*, 1872-75, vol. i., vol. ii. part 1, 2 vols. 8vo (severely criticised by Cliffe Leslie, translated in the *Bibl. dell' Economista*); the third edition was called *The Elements of Economics*, 1881-86, 2 vols. sm. 8vo. *Definition and Nature of the Science of Political Economy* was a paper read at Cambridge 1862. *Elements of Banking*, 1878, 7th ed. 1883, sm. 8vo. *Economics for Beginners*, 1878, 5th ed. 1899, sm. 8vo. *Lectures on Credit and Banking*, delivered at request of Institute of Bankers in Scotland, 1882. *On the Modern Science of Economics* was read before the Manchester Statistical Society 1887. *The Theory of Credit*, 1889-91, 2 vols. 8vo, 2nd ed. 1893-97, 2 vols. in 3, 8vo, reissued in one vol. 1898, 8vo. *Address to Civil Service Commissioners on the Teaching of Economics in the Civil Service*, 1892, folio. *Bimetallism*, 1894, 1st and 2nd ed. 8vo (enlargement of ch. vii. *of Theory of Credit*). *Gresham's Law* and *Bimetallism in France* (*1803-74*) were two pamphlets issued by the Gold Standard Defence Association, 1895. *History of Banking in Great Britain*, being vol. ii. of *History of Banking in all Nations*, 1896. *The History of Economics*, 1896, 8vo. *Credit*, paper read before National Liberal Club, 1897. *Indian Currency*, 1898, 8vo. *Draft Tentative Scheme for restoring a Gold Currency to India*, 1898, privately printed, folio. H. R. T.

MARTIN, John Biddulph (1841 - 97). Educated at Harrow and Exeter College, Oxford, he entered the Banking House in Lombard Street with which his family have so long been connected, at an early age. Assiduous in his business duties even to the minutest detail—thus when his turn came round he was most careful to attend to the unlocking the safe of a morning at 9 A.M., as his father and uncles had done before him and as his partners did — he yet found time to work on many subjects of public interest connected with his profession. His paper on "Our Gold Coinage," 1882, an able statistical inquiry into its defective condition at the time, with extremely careful statements showing the depreciation of the coinage from 1817, the date when our gold coinage was resumed in its present form, followed as it was by another paper in 1883 on the same subject by the present writer, was of great service in promoting the recent reform of the gold currency. This paper appeared in the *Journal of the Bankers' Institute*, to which, as well as to the *Journal of the Royal Statistical Society*, he was a frequent and valued contributor. He was President of the last-named Society at the time of his death. His article on "The Evolution of our Banking System" in the *Economic Journal* for 1891 is a very able sketch of the growth of the business, written as it only could have been by a man who had an accurate knowledge both of the history of the past and of the practice of present times. To this Dictionary he contributed the article on Respondentia Bonds. When the Editor asked him to write this article, he felt there was hardly any other man in the City who could have undertaken it.

The most important work by John Biddulph Martin was "*The Grasshopper*" *in Lombard Street*, the premises where the business of the firm is still carried on, the history of the Banking House which was at one time the property of Sir Thomas GRESHAM, whose crest, the Grasshopper, the name commemorates. The family of Martin has long been connected as Goldsmiths with the City. Sir Richard Martin was Lord Mayor of London in the Armada year, 1588-89, and again in 1593-94, and the name has long been conspicuous in the annals of Lombard Street. The volume is a most interesting record, both of families connected with the business of banking and of the rise and progress of the business itself.

MAZZOLA, UGO (1863-1899), was born at Naples and died at Courmayeur. The son of a merchant, he had been accustomed to see the application of economic laws ever since his childhood. He studied economics at Naples, under Professor Ciccone and from the works of Fr. FERRARA, taking his degree at an age at which most others are only beginning to prepare for it. Possessing most modern languages —including Dutch—and gifted with uncommon intelligence, the Government appointed him, at the age of twenty-two, to study the question of workmen's insurance by the State. For this object he went in 1884 to Berlin, where he had the privilege of attending the lectures of Professor A. Wagner. His first book, on *Insurance of Workmen*, was published by the Ministry of Agriculture, Industry, and Commerce, and was considered as exhaustive. He was early appointed to the chair of political economy in the small university of Camerino, teaching there public finance and statistics besides political economy. A convinced free-trader, he undertook to write the "Chronique" (history of current events) for the *Giornale degli Economisti*, which he had bought with a couple of friends. His chronicles were as witty and caustic as if BASTIAT had reappeared to write them, and naturally gained for him as many enemies as friends. Not content with writing chronicles, he would travel all over Italy delivering speeches. His scientific activity was principally roused by financial problems, viz. the alterations in economic equilibrium through governmental interference, in the shape of taxation and of public services substituted for private enterprise. A book on the *Fundamental Data of Public Finance* obtained for him the chair of finance at Pavia, where COSSA was teaching political economy. The sudden death of Mazzola's father obliged him to break off his scientific work for more than two years, in order to unravel the intricate affairs of a wholesale cloth importer. Disease began to undermine his health. When he returned to scientific work he wrote on German colonisation in the Polish provinces of Prussia. His book was republished by the Ministry of Agriculture, Industry, and Commerce as a guide for and to supply materials for those who are interested in internal colonisation in Italy (Sardinia and several regions of the south of Italy). His last book was on *Progressive Taxation*, in which he shows, by historical analysis, that theoretical principles have, as a matter of fact, always had very little to do with it in comparison with political forces which have decided its acceptance or rejection. Besides his books, Mazzola has left two excellent monographs, one on *Fiscal Monopolies* and one on the *Land Tax*. Increasing ill-health put an end to his activity before he was thirty-six. He was considered the ablest of the younger Italian economists of his time. M. P.

MEAN,* FREQUENTIAL (in Statistics). This form of average proposed by Fechner, and called by him *Dichtester Werth*, is determined by the frequency of occurrence. "If we arrange the data according to their value or quantity, and then divide this series into equal portions, a certain unevenness of distribution will be noticeable; if we then take the most crowded portion and from it its central item, we shall obtain a value which, in certain cases, may be used as the representative of the whole series, it being the one which actually occurs more frequently than any other" [see AVERAGE; MODE, in Statistics, Appendix].

[See Ernst G. F. Gryzanovski, "On Collective Phenomena and the Scientific Value of Statistical Data," *Publications of the American Economic Association*, August 1906.]

MENGER, DR. ANTON (1841-1906), was born at Maniow in Galicia and died at Rome, being the youngest of three brothers, all of them writers on social and economic questions, of whom the eldest, Maximilian, was a member of the Austrian Reichsrath, and the youngest, Carl, was one of the most celebrated champions of the deductive against the historical school. Anton was trained as a jurisconsult at Vienna University, and after obtaining the right of Private Lecturing in 1872, and becoming Professor Extraordinary in 1874, was in 1877 elected Professor of Civil Procedure, which post he held until he retired on a pension in 1899. His earliest publications apparently dealt solely with legal procedure, but he soon turned his mind to the treatment of social problems from their juristic aspect, and the publication in 1886 of his first and perhaps greatest economic work, *Das Recht auf den vollen Arbeitsertrag in geschichtlicher Darstellung*, marked the completion of the change. This work was translated into several languages, and in 1890, in "The Civil Law and the Non-propertied Classes," he criticised the proposed Bill for a code of civil law for the German Empire. His practical influence, indeed, was not confined to this measure, but is visible in the German Statute Book generally and in two Austrian Statutes, Civil Procedure, 1895, and Civil Executions,

1896. In 1895 he became Rector of Vienna University, and chose "The Social Problems of Jurisprudence" as the subject of his Rektoratsrede. On his retirement from the Chair of Civil Law in 1899 he became Honorary Professor of the Law of Civil Procedure and of the Philosophy of Law; and he has left some further works on social and ethical theory, and an unpublished manuscript on "Politics for the People." He died at Rome in February 1906.

The combination in Dr. Menger of legal training and legal methods with socialistic opinions and sympathies enabled him to give birth to a new type of juristic socialism. He never wholly ceased to be a jurisconsult, and as a result he subjects the projects of his party to a severe and impartial though sympathetic analysis. In the introduction to his chief work he declares "a juridical elaboration of socialism to be the most important task of modern jurisprudence, the right accomplishment of which will materially assist the peaceful reform of our social conditions," and he despaired of much practical achievement until "socialistic theories are laid down as bare legal conceptions denuded of the endless economic and socialistic literature which form their main contents." *Das Recht* was, indeed, intended by its author to be the "fragment" of a synthesis of socialism as a body of legal rules; but this work unfortunately was never completed. This aspect, however, was not so much that of the practical jurisconsult as based on the philosophy of law; for, as Professor Foxwell (*see below*) points out, it was not legal rules (*lex, loi, gesetz*) but ideal right (*jus, droit, recht*) with which Menger dealt. "To him jurisprudence was merely a reflection of traditional legal customs, but the new philosophy, the jurisprudence of the have nots, was in his opinion the real science of socialism"; and to the support of such a system all his published works have in some form or other been devoted.

The influence of this standard is most marked when we come to his economic method, which is as critical and analytic as the most precise could desire. *Das Recht*, his chief work, is partly abstract in character, but the remainder of it is historical. The former method is found in his analysis of the main socialistic doctrine of the Right to the whole produce of labour, and in tracing the development of this all defects of reasoning and insufficiency of research obtain short shrift. On the North German School he is particularly severe, describing their method as "subversive of all rules of historical research and resulting in a constantly increasing dead-weight of errors and misconceptions." An analysis of some of the chief socialistic doctrines leads him to the conclusion that they are mutually incompatible, and he adjudges the Right to Subsistence to be the more important claim, to which therefore the Right to the Whole Product must give way. The rest of the book traces historically the origin of the latter theory from the earliest English and French socialists —Godwin, Hall, Thompson, and the St. Simonians (see St. Simon)—whose originality he vindicates against the Northern German School and the pilfering of Marx and Rodbertus, who borrowed the theory from them without acknowledgment. "To men," he wrote, "who bore in their lives besides other persecutions the grief of being unappreciated and forgotten, there is at least due the justice of immortality as the originators of world-moving thoughts."

Unlike his brother Carl, Anton Menger contributed little or nothing to the pure theory of economics; but his work gave him a place of his own as the founder of Juristic Socialism, in which he has had no prominent follower, and Jurisprudence itself has benefited by this connection with Socialism. The *Das Recht* itself, Professor Foxwell says, is "a most felicitous and vigorous study of the historical evolution of socialist doctrine. . . . Broad but sketched with singular accuracy of learning." "The pattern of a fearless thinker who shrinks from no consequences, of a warm-hearted advocate of the non-propertied classes," wrote Mr. Victor Graetz in the *Economic Journal*. His works were:—

Das Recht auf den vollen Arbeitsertrag in geschichtlicher Darstellung, 1886-1891; translated into English with introduction by Professor Foxwell, 1899.—*Gutachten zur Errichtung einer eidgenössischen Hochschule für Rechts- und Staatswissenschaft*, 1899.—*Das bürgerliche Recht und die besitzlosen Volksklassen*, 1890.—*Die sozialen Aufgaben der Rechtswissenschaft*, Rektoratsrede, 1895.—*Neue Staatslehre*, 1903.—*Neue Sittenlehre*, 1905.—*Volkspolitik* (in manuscript); and two articles, "Sozialismus und der Sozialpolitik in der Zukunft," 1887; "Die soziale Bewegung und Kulturwelt," 1899.

[See Professor Foxwell's Introduction to M. E. Tanner's Translation of *Das Recht*, London, 1899.—Luigi Cossa, *Introduction to the Study of Political Economy*, English Translation, 1893.—*Handwörterbuch der Staatswissenschaften* (Jena, 1900) for Biography by Josef Stammhammer, and *Economic Journal*, June 1906, for obituary notice by Victor Graetz.—*Jahrbuch für Nationalökonomie und Statistik*, 1888, by A. Adler; 1890, by E. Loening; and Gustav Schmoller in *Jahrbuch für Geschichte und Verwaltung*, 1889.] N. B. D.

MENGER, Karl (1840-1921), Professor of Economics at the University of Vienna, 1873, was one of the founders of the Austrian School of Economists (*q.v.*). In 1876 he was appointed tutor in economics and statistics to Prince Rudolf, and travelled with him to England, France, and Switzerland, until 1878, when he resumed his work at the University. In 1900 he was made a life member of the Austrian Upper House, and resigned his University chair in 1903.

Menger was an adherent of the theory of

FINAL UTILITY (*q.v.*) and of the QUANTITY THEORY OF MONEY. His influence made itself felt in the adoption by Austria of the gold standard. An ardent collector of economic writings, he was nevertheless a strong opponent of the German historical school. His principal works are: *Grundsätze der Volkswirtschaftslehre*, 1871; *Der Obergang zur Goldwährung*, 1882; *Zur Theorie des Kapitals*, 1888; *Grundsätze einer Klassifikation der Wirtschaftswissenschaften*, 1889, and *Beiträge zur Währungsfrage in Österreich-Ungarn*, 1892. H. H.

MESSEDAGLIA, ANGELO (1820-1901), was born at Villafranca, Verona, and died in Rome. Three men have been the direct teachers of all Italian economists since the renewal of economic studies in Italy: COSSA, FERRARA, and Messedaglia. Each of them acted in his own special way. Cossa was incomparable in bibliographical knowledge and in systematising economic doctrines. Ferrara was an original thinker, a creator of new knowledge. Messedaglia was a statistician, a logician, a teacher of method. He was a slow worker, and would keep a problem he was studying for years and years on his desk without being induced to utter an opinion.

His publications are not numerous, but each of them became in time a standard book of Italian economic literature. In 1850 he published a volume on public debts and the best methods of consolidation, *Dei prestiti pubblici e del miglior sistema di consolidazione*, Milan. In 1858 he began his demographic publications by *The Methods of the Theory of Population Considered* (*Della teoria della popolazione principalmente sotto l' aspetto del metodo*), Verona. They were continued in 1864 in an essay on GUERRY DE CHAMPNEUF, and in 1866-67 in *Studies on Population*, published, like the last mentioned, in the acts of the Venetian academy (*R. Istituto Veneto*). The general methods of statistical research were the subject of introductory lectures to his courses of lectures in 1872, 1874, 1877, published in the annals of the universities of Padua and Rome, and in the *Archivio di Statistica*. They were also the subject of monographs whose titles are: *Methods in Statistics*, 1879; *Criminal Statistics*, 1879; *Some Problems in Theoretical and in Italian Statistics*, 1880; *Calculus of Mean Values and their Use in Statistics*, 1880; all published in the *Archivio di Statistica*. In 1881 he took up monetary problems and wrote one of the very best books Italian literature has on this argument, dividing it into two parts, *The History and Statistics of Precious Metals*, and *Money and Monetary Systems in General*. This publication also appeared in the *Archivio* for 1881, 1882, 1883. Messedaglia was for several years a deputy and was then appointed a senator. In this latter quality he reported on several economic subjects. One of his reports, on the reform of the land tax, has become a standard book on the *History and Methods of the Cadastre*, 1882.

Messedaglia's drift of mind would always lead him to a minute study of facts. In the question of land tax he would go into the most minute technical details of the *Cadastre* (see CADASTRAL SURVEY); in monetary problems he would go into technical details of banking, of mint methods, of industrial uses of metals, of customs and habits of hoarding, of practices in negotiating drafts, and did his best not to omit the action of the most minute influence. In public finance he would again take into consideration not only positive legislation, but also its working in real practice. He was a positivist by temperament. Concise in speaking and writing, slow and monotonous in oral lectures, he was attractive in that he never said a useless thing. He would never indulge in polemics, and it was impossible to make him lose his temper. He was highly respected by students and colleagues for his great breadth of knowledge, which never made a person who was speaking before him feel sure that he was not in the presence of a man who, though remaining silent, knew more about the argument than the speaker. M. P.

MEYER, HERMANN RUDOLPH (1839-1899), born at Friedeberg, described as a "social conservative" (*Konservativer Volkswirt*), assisted Hermann Wagener in journalistic work, sharing his views as well as those of RODBERTUS on economic questions. These led him into conflict with the Prussian Government and to his departure from Germany in 1877. For a time he lived in Austria, where, his sympathies drawing him to the conservative party, he lent his assistance to the reform of the law concerning factories and corporations of artisans. Being unable to reconcile his views on corn duties with those of the Austrian aristocracy, he left Vienna, and after further travel settled in Canada in 1881, became naturalised as a British subject, and engaged in farming. Ill-health compelling him to return to Vienna, he again became interested in Austrian politics on the conservative side, while his experience in farming enabled him to oppose agrarian protectionism.

His principal writings were *Der Emancipationskampf der vierten Standes*, 1872-74, 2 vols., 2nd ed. of vol. i., 1882, an impartial statement of Socialism.—*Capitalismus fin de siècle*, 1894.—*Hundert Jahre konservativer Politik und Literatur*, 1896.

[See *Economic Journal*, vol. ix., London, 1899.—*Handwörterbuch der Staatswissenschaften*, giving complete list of works, vol. v., Jena, 1900.]

MIKLASHEVSKY, IVAN (1858-1901), Professor of Political Economy and Statistics at the University of Kharkoff, took a keen interest in the economic and social movements of his day. His principal work was a *History of Village Economy in the State of Moscow: the Formation and Management of the Villages in the Southern Frontier of Russia in the Seventeenth Century*. At the time of his death he was preparing further work in continuation of this. He contributed a brief but brilliant

sketch of the history of economics in Russia to this Dictionary (see RUSSIAN SCHOOL).

MODE (in Statistics). If we consider a series of instances of a kind of quantity, that value of the quantity in whose neighbourhood the largest number of instances is found is termed the *mode* of the series. In other words, the mode, or, as it is also called, the maximum ordinate average, is the value in whose neighbourhood the instances cluster most densely. See AVERAGE.

MOLINARI, GUSTAVE DE (1819-1912), waged a long warfare as a journalist and man of letters upon protection, socialism, and irreligion. Born at Liége, he entered the ranks of journalism in Paris, and published in 1843 *L'Avenir des chemins de fer*, followed by a number of other writings: *L'Organisation de la liberté industrielle et l'abolition de l'esclavage*, 1846; *Histoire du tarif: les fers, les houilles, les céréales*, 1847; *Les Soirées de la rue Saint Lazaire*, 1849. In 1852 he became Professor of Political Economy at the Royal Brussels Museum of Belgian Industry, and later at the Institut supérieur du commerce at Antwerp. Returning to Paris he joined the *Journal des Débats* in 1867, and became its editor (1871-1876). He edited the *Journal des économistes* from 1881 to 1909. His other principal writings are: *Le Mouvement socialiste et les réunions politiques avant la Révolution du 4 septembre 1870*, 1872; *Les Clubs rouges pendant le siège de Paris*, 1871; *Les Bourses du travail*, 1893; *Comment se résoudra la question sociale*, 1896; *Les Problèmes du XX^e siècle*, 1901; *Économie de l'histoire; Théorie de l'évolution*, 1908; *Ultima verba*, 1911. H. H.

MUNICIPAL AND GOVERNMENT TRADING. In my book on Municipal and Government Trading I have endeavoured to prove, and I see no reason to change my opinion,

1. That local expenditure is increasing more rapidly than rateable property.

2. That local indebtedness is increasing more rapidly than rateable property.

3. That municipal trading cannot fail to give rise to difficult labour problems, and may lead to serious corruption.

4. That profits are only made, if at all, when municipalities have a monopoly; they are confined to businesses such as the manufacture of gas, which has long been established and reduced to regular rules; that even in such cases the accounts have been so kept as to make it impossible to determine what the real result has been; that the profit, if any, has been but small; and that much more satisfactory and remunerative results might have been obtained if the works had been leased to private companies or firms.

5. That municipal trading has seriously interfered with private enterprise and our foreign commerce.

6. That the State management of railways is open to similar objections; that on State railways the fares are higher, the trains slower, fewer, and less convenient, and that to introduce questions of railway management into the domain of politics is open to serious objections.

7. That it is unwise to give votes to those who pay no rates, and unjust to withhold them from those who do.

8. That Government and Municipal Trading, by reducing the demand for labour, while increasing prices and raising rates, has not only injured the ratepayers generally, but especially the working classes; and that if carried to its logical conclusion, it will involve the loss of their freedom.

That the burden of our rates is not only excessive but increasing, no one can deny; and they will inevitably continue to rise unless some change is made in our policy.

Sir J. W. Benn, though he has himself been one of the most able and active supporters of municipal trading and lavish expenditure, recently admitted in the debate on the Agricultural Rates Bill in the House of Commons that "the position of the London ratepayer has become critical. The increasing rates of London are driving away industries by the dozen," and what is true of London holds good also with reference to other great cities.

In spite of the prosperity of our commerce, the building trade is depressed, and no wonder. If it had not been for the increase in the rates many a man would have improved his house, many a railway company would have enlarged their stations, or in other ways have afforded more accommodation to the public, and thus given additional employment to labourers and artisans. We are told, no doubt, that municipalities make profits. But this is only the case where, as in gas-works, they have a monopoly. Of course if you have a monopoly and can charge what you like, it is easy to make a so-called profit. They charge the ratepayer a high price and call it a profit.

All monopolies are bad, but Government and Municipal monopolies are the worst, because, when once established, they can neither be regulated, controlled, nor abolished.

By recklessly running the Thames steamers the County Council admit that they lost over £50,000.

The more this policy has been carried out the worse for the working man. West Ham is a case in point. The rates are very high, industry is driven away, there is too little employment, and the working man suffers in consequence.

The programme of Socialists is that "all the means and instruments of material production, distribution, and exchange should be owned and controlled by the State."[1] Socialists no doubt think that they are acting in the interest of the

[1] *The Times*, Oct. 6, 1906.

working classes. They are entitled to their opinion, and I make no reproach, though I do not agree with them.

Under their system not only railways, tramways, and gas-works, not only manufactories and building concerns, but shops also—milk shops, bakers, butchers, grocers, and the rest—would be run by the County Council.

Perhaps it will be said that tramways and waterworks should be worked by the London County Council, but that shops would not be interfered with. But where are we to stop? Why tramways and not omnibuses or cabs? Why water and not bread or meat? Indeed, at a meeting of the Society of Arts, Mr. Burns was asked "Whether it was his view that all private property, what he called the instruments of production, should be in the hands of the State or the municipality?" Mr. Burns replied, "Yes."[1]

Moreover, it is surely evident that municipal employees should not elect their own employers. Town councillors will have to regulate the wages of their electors. The temptation to set the wages against the votes must increase till our municipal governors are placed in a difficult, if not an impossible position.

This policy is generally advocated as being in the interests of the working man. But those who are engaged in commerce know that success depends on close attention to details, on watching the turn of the market, on giving mind and thought to the business. It is impossible for the members of municipalities to do this, and, consequently, municipal management cannot be as economical or as successful as private management.

Sir H. Campbell Bannerman, Sir Edward Grey, and Lord Rosebery all agree that the London County Council is greatly overworked. The London County Council cannot look after the details as private firms and companies would; the services and products must therefore be more expensive. The national output will be less. Wages in the long-run are governed and determined by international competition. Municipal Councils could not raise their wages or they would ruin their markets. Moreover, as Governments and municipalities would not increase their works, or adopt improvements so rapidly as private firms and companies, the demand for labour would be less. The difference could not then be thrown on private enterprise as it is now, because private enterprise by the hypothesis will have been done away with, or rather, will have been driven over-sea. With the same, therefore, or probably with lower wages, working men would have to pay a higher price for the necessaries of life.

But this is not all. At present they are free. They can choose their employer and their employment. Under the new system this would not be possible. They could not choose their employer, for there would only be one. Nor could they choose their employment. If the State or the municipality is to be responsible for them, workmen would have to do as they are bid. At present, if they do not like their work or their employer, they can change. That would be impossible under the new system which they will have created for themselves. Socialists frankly admit this. For instance, the Fabian Society says: "Every one should have a legal right to an opportunity of earning his living in the society in which he has been born; but no one should or could have the right to ask that he shall be employed at the particular job which suits his peculiar taste and temperament. Each of us must be prepared to do the work which Society wants doing, or take the consequences of refusal." (Fabian Tract No. 127, "Socialism and Labour Policy. Municipal and National Trading," p. 154.)

But who is to determine what "Society wants doing"? Some superior official. I shall be indeed surprised if British workmen are prepared to surrender their personal freedom and reduce themselves to the position of slaves! Bureaucracy is the worst form of tyranny.

The result to the working classes, then, would be less employment, lower wages, dearer necessaries of life, and—the direst misfortune of all—the loss to a great extent of the personal freedom they now enjoy.

As regards the conduct of commercial undertakings by Government, perhaps the best case to take is that of railways. It is extremely difficult to compare the work done in Government dockyards with that of private shipbuilding yards, though it would doubtless be wise to restrict the former within narrower limits. As regards railways, it is more easy to contrast the two systems.

Take, for instance, the case of India. Mr. Horace Bell, of the Railway Department of the Government of India, not long ago read an interesting paper before the Society of Arts. He said that he was at first very much in favour of the management of railways by the Government, but the result of his experience was to convince him that . . . "the only means of introducing a new and vigorous life into Indian railways is by inducing a free and unrestricted flow of private capital to India, and that this implies the gradual, but eventually complete, abandonment of State administration." (*Journ. Soc. of Arts*, No. 2371, vol. xlvi.)

In the course of the discussion, Sir Juland Danvers, who has represented the Government on the Boards of the Indian railways from their infancy, and speaks with perhaps unrivalled experience, expressed his opinion that . . . "the agency of companies was, upon the whole, the most satisfactory mode of carrying out railway enterprise. That seemed to be now the opinion of the Government. Railways being commercial concerns were better in the hands of those who

[1] *Journal of the Society of Arts*, No. 2413, vol. xlvii. 269, 270.

could manage them on commercial principles; if the choice was between a State and a Company, the latter was, on the whole, most desirable."

The results, indeed, have been so unsatisfactory that the Government recently selected Mr. Thomas Robertson to make a Report on the administration and working of the Indian Railways. After an elaborate inquiry, he came to the conclusion that . . . "the working of the Indian railways cannot be regarded as at all satisfactory. But I attribute this more to the system than to any individual action on the part of the railway or Government officers. . . . But after long and anxious consideration, the conclusion forced on me is that root-and-branch reform alone will be productive of lasting good, and that if the development of railways in India is not to be hampered, and if they are to render that full and efficient service to the country of which they are capable, they must be permitted to be worked more as commercial enterprises than they have in the past." (*Report on the Administration and Working of Indian Railways*, 1903.)

He points out that the average speed "is not as high as might have been expected"; that it "is so slow as seriously to interfere with the proper development of the traffic"; and that "before the rates and fares in India can be regarded, relatively, as equal to those in England, the former will require to be lower than the rates now charged—for passengers, by about 18 per cent to 40 per cent; for general merchandise, by about from 30 per cent to 60 per cent; and for coal, by about 40 per cent to 60 per cent." As to the result of Government interference in the construction of railways, we have an object-lesson if we compare India with Argentina, where the construction and management of railways have been wisely left to private enterprise. The population of India is (1911) over 315,000,000, and the miles of railway 33,000, or one mile to every 9500 people. In Argentina the population is mainly Spanish, and the country is agricultural. The Government has been in great financial troubles. Nevertheless, with a population of 6,800,000, they have over 16,000 miles of railway—mostly made with English capital,—or a mile to every 412 persons. If India had the same mileage of railways in proportion to population, she would have, not 33,000 miles of railway, but 784,000 miles. Now, why does English capital go to make railways in a foreign country, and not to India, a part of our Empire? Because, as the Government interferes, others are deterred from entering the field. They naturally say, if any line is proposed by private enterprise, that, if it were likely to pay, the Government would make it. I cannot doubt that the policy of successive Governments in this respect has had a serious and unfortunate effect on the prosperity of India.

The present Lord Farrer,[1] in conclusion, tells us that after his careful comparison . . . "it certainly appears from our figures that those countries which have been given freest scope for private energy have obtained the fullest reward. It is frequently forgotten that in questions of administration, Government officers are only human beings after all, and do not differ in kind from other individuals, while the able and original-minded men among Government servants are certainly more hampered—by quite unnecessary red-tape regulations—in carrying out fresh ideas than are the servants of private enterprise. The danger of this criticism developing into complete control is the rock ahead, for as soon as Government obtains control, private enterprise will wither."

Mr. Acworth[1] concludes his inquiry as follows:—"A careful study of the evidence has convinced me that in the long-run State control ends in keeping down the best to the level of the worst, and that, taking them for all in all, the private railway companies of England and the United States have served the public better than the Government railways of the Continent or of our Australian Colonies, and—which is still more to the point—are likely to serve it better in the future." The late Lord Farrer said,[2] "The development of railway communication in Great Britain has been such as no Government management, however good, could possibly have produced."

No one, indeed, who looks dispassionately into the evidence can doubt that the State management of the railways has been a great misfortune for the Continent, and that our trade and commerce have benefited immensely by the energy and enterprise of our railway companies and their very able officials.

In cases where a monopoly is almost inevitable the "sliding scale system," adopted in London and several other places, is better for the ratepayers than that of municipal management.

Under this system a sliding scale of price and dividend has been adopted, under which, starting from a given point of price and dividend, the gas companies are enabled for every penny per thousand feet by which they reduce the price of gas to add a quarter per cent to their dividend, so as to divide any additional profit they may make between the companies and their consumers. As regards capital, gas companies coming to Parliament for power to raise money are required to put up to auction all the fresh capital they require, so that any premium upon the shares goes into the plant and stock of the company, and not into the pockets of the shareholders. This plan not only gives the consumer a share in increased profits, but also gives the companies a motive for economy.

[Lord Avebury, *On Municipal and National Trading*, London, 1906.—Hugo Robert Meyer, *Municipal Ownership in Great Britain*, New York, 1906.] A.

MUNRO, J. E. C. (1849-1896), born in County Down, was educated in Ireland at the Royal Belfast Academical Institution, and at Queen's College, Belfast, graduating as B.A. in 1871, and at Cambridge, where he studied law and economics, obtaining in 1874 the second place in the Law Tripos. After being called to the Bar and practising for a short time, he was appointed, in 1882, Professor of Law and Cobden Lecturer in Political Economy at Owens College, Manchester. He resigned these posts

[1] Foxwell and Farrer, *Express Trains.*

[1] *The Railways and the Traders.*

[2] Farrer and Giffen, *The State in its Relation to Trade.*

in 1892 and 1890 respectively, and returned to London to practise as a barrister. He was Reader in Roman Law to the Inns of Court for some years, and Examiner in Jurisprudence to the University of London, 1889-94.

Besides the numerous articles which he contributed to this Dictionary, he wrote various pamphlets and papers for the *Economic Journal*, the *Proceedings of the British Association for the Advancement of Science*, and the *Proceedings of the Manchester Statistical Society*; the papers on the "Sliding Scale in the Coal Industry," the "Sliding Scale in the Iron Industry," and the "Probable Effect of an Eight Hours' Day on the Production of Coal and the Wages of Miners," being some of the most important. He was a member of the Council of the British Economic Association and of the Royal Commission on Mines, President of the Manchester Statistical Society for one year, and worked for Section F (Economics) of the British Association.

[See *Economic Journal*, vol. vi., London, 1896.]

suspn. = suspension
Switz. = Switzerland
syst. = system

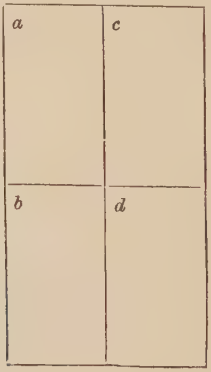
U.K. = United Kingdom
U.S.A. = United States of America

W. = west
wh. = which

Names of persons noticed in the Dictionary appear, in the index, in small capitals, as J. S. MILL: titles of other articles in heavy type, as **Value**; foreign words, not being titles of articles, and names of books, in italics, as *Villa*, *Wealth of Nations*. A colon indicates the end of the index-heading: individual references are separated by a semicolon; groups of references by .——

* An asterisk signifies that the article is in two parts, of which one is in the Appendix.

In each reference the number indicates the page, while the letter indicates a *division* of that page; *a* and *b* referring to the *upper* and *lower* halves of the *left*-hand column, *c* and *d* to the *upper* and *lower* halves of the *right*-hand column. Thus, **Absentee**: J. R. M'CULLOCH on, 657 *b*, refers to page 657, the lower half of the left-hand column. The diagram subjoined shows the method followed:—



INDEX

Absentee: J. R. M'Culloch on, 657 *b*.
Abstinence: theory of Interest, 426 *c*, 428 *a*; F. Lassalle on, 427 *d*, 568 *b*.

Demand: and International Value, 451 *cd*. ——Demand Curves, H. H. Gossen on, 233 *b*; K. H. Hagen on, 272 *b*; and Higgling of Market, 305 *a*.——Demand, Law of, and Price, 582 *d*; Utility, Dimin., 583 *ab*.——Demand and Supply, illustr. by Curves, H. C. F. Jenkin on, 473 *bc*; Law of, 473 *bc*.——Demand, marginal, doctrine of, M. Longfield on, 917 *d*.

Demesne tenants, origin of Copyhold: 28 *b*.

Demography: word invd. by A. Guillard, 270 *b*.

Demoivre, A., on Annuity on Life: 416 *a*.

Denominator, Common: Ideal Money as, 793 *d*; W. S. Jevons' measure of Value, 789 *d*; F. A. Walker on, 789 *cd*, 793 *abcd*.

Depopulation, as symptom of Famine: 21 *d*.

Depreciation of Monetary Standard, Lord King on: 506 *c*.

Depression, Agricultural: Effects, 30 *ab*.

De Sanctis, M. A., on scarcity of Money: 462 *c*.

Development: J. G. Fichte on, 55 *d*, 502 *b*; G. W. F. Hegel and idea of, in Econ., 55 *d*, 296 *c*, 297 *a*, 502 *b*, 705 *c*; B. Hildebrand on, 305 *d*, 311 *d*; leading principle in Historical Meth., 308 *d*; W. Roscher's theory, 311 *bc*.

Differential calculus: Example of use, 423 *d*; and Mathematical Meth., 711 *b*; Meth. of use, 423 *cd*.

Diffic. of Attainment, J. S. Mill on: 760 *d*.

Dîme Royale: V. R. de Mirabeau on, 372 *c*; S. le P. Vauban's project, 63 *c*, 155 *c*, 372 *c*.

Dimin. Returns, law of: 583 *a*, 746 *b*; illustr. by Functions, mathematical, 168 *c*; illustr. by Intensive cultivation, 424 *d*; R. Jones on, 490 *c*; T. R. Malthus on, 672 *bc*; J. S. Mill on, 759 *a*; and Rent, 672 *bc*.

Discommodity, Labour regarded as: 516 *a*, 691 *b*.

Discount, Rate of: changes in, a guide to condition of market, C. Juglar on, 912 *c*.

Distress, in Industrial Revolution: 400 *d*.

Distribution: of materials of nourishment, T. Hobbes on, 316 *a*; of wealth, and Ital. Sch., 464 *b*, 910 *bc*; and rel. of Labour and Capital, 517 *d*; of wealth, M. Longfield on, 640 *b*; J. S. Mill on, 759 *b*; and Prodn., 518 *b*.

Dividend: Foreign Dividends, and Imports, 99 *c*; True and spurious, 99 *d*.
Dock Labour, and Irregularity of Employment: 458 *d*.
Domicil: and Bankruptcy, 448 *cd*; infl. of, 442 *d*, 447 *a*-449 *b*; and Inheritance, 447 *d*, 455 *c*; and Jurisdiction, Scot., 495 *b*; and Marriage, 447 *cd*, 449 *b*, 905 *b*, 906 *a*.
Drapier's Letters, J. SWIFT'S, and W. WOOD'S patent: 795 *b*.
Drawbacks: and Bonded warehouses, 370 *a*; and Import Duties, 370 *a*.
DUPONT, P. S.: Impôt unique, 372 *b*.
Dutch E. Ind. Co.: 265 *b*, 347 *d*.
Dutch trade, decline of, E. LUZAC on: 655 *c*.
Duty: disadv. of Ad valorem, 369 *cd*; on Inhabited house, hist. of, 407 *d*.
Dwellings, Reguln. by the State in Eng.: 537 *c*.

Earnings of Management: first investigated by H. K. E. von MANGOLDT, 683 *b*; a species of Wages, 517 *a*.
Easterlings or **Hansards**: 279 *a*, 284 *a*, 285 *b*.
E. Ind. Companies, Foreign: 576 *d*, 819 *bc*.
E. Ind. Co.: 147 *c*, 275 *b*, 324 *b*, 601 *d*, 729 *b*, 778 *d*, 829 *b*; and Coinage, Ind., 780 *bcd*; home Competition, 216 *c*; and Econ. settlement of Ind., 361 *c*; and Factories, 3 *d*; v. SANDYS, and Interlopers, 437 *a*.
Eastland Co.: 436 *d*.
ECK, J., on Int. and Usury, Triple Contract: 435 *d*, 663 *d*.
Economic: Econ. Man, conception of, by Classical school, 876 *cd*; by Deductive economists, 525 *c*.—Econ. Organisation and Civilisation: Nation, 630 *cd*.
Economics: Sci. of, N. FORTUNATO on, 121 *c*; J. K. INGRAM on, History of Economic thought and systems, 896 *c*; W. S. JEVONS on, calculus of human satisfactions, 477 *c*; M. MINGHETTI on, 768 *c*; D. G. MORHOF on, 199 *b*, 820 *d*; Physiocrats on subject of, 155 *d*; Social dist. fr. political and psychological sci., 741 *ac*.—Economics, Teaching of: Italy, revival of, F. FERRARA, 856 *d*, 857 *a*.—Econ. sci., Meth. of: Analytical, 744 *bc*; A posteriori, 744 *ab*; Chemical (empirical), Macaulay's, J. S. MILL on, 637 *d*; Divis. of, 740 *a*, 741 *bd*; Experimental, use of, 391 *d*; Geometrical or deductive, James MILL on, 637 *d*, 756 *a*; B. HILDEBRAND on, 311 *d*; C. JANNET on, 471 *d*, 472 *a*; Literary, of Classical Sch., compd. with mathematical, 712 *a*; Regulative and positive, connexion of, 740 *bc*; Econ. sci., Abstract meth., compd. with Concrete, 743 *d*; F. B. W. HERMANN on, 202 *c*, 302 *b*; compd. with Historical, 309 *a*.—Econ. sci., A priori meth., 744 *ab*; J. S. MILL, 757 *bc*.—Econ. sci., Constructive meth., Analytical and Synthetic, 744 *b*; A priori and A posteriori, 744 *ab*; Evolution and dynamics, 743 *bc*; Inductive and Deductive, 743 *cd*, 744 *ab*.—Econ. sci., Deductive Meth.; appl. to advanced societies, W. BAGEHOT on, 747 *a*; J. E CAIRNES, 747 *a*; Direct and indirect, J. S. MILL on, 638 *a*; and Econ. Man, 525 *c*; necessity of combination with Inductive, 683 *b*, 743 *d*, 744 *a*, 747 *bc*; W. S. JEVONS on, 476 *a*, 746 *d*; T. E. Cliffe LESLIE on, 747 *a*; J. S. MILL on, 638 *a*, 747 *a*; Postulates of, Physical laws of Increasing and Dimin. returns, Psychological laws of Demand and Supply, Social conditions of freedom and restraint, 746 *bcd*.—Econ. sci., Formal-descriptive meth, and Classification, 742 *c*; and Definitions, 742 *a*.—Econ. sci., Historical Meth., compd. with Abstract, 309 *a*; Abstract element in, 308 *d*; A. COMTE and Sociology, 310 *d*; compd. with Concrete, 309 *a*; Development a leading principle of, 308 *d*; B. HILDEBRAND, 305 *d*, 311 *d*; compd. with Inductive, 309 *b*; K. KNIES on, 912 *b*; A. MENGER on, 920 *bc*; J. S. MILL on, 759 *d*; J. MOSER on, 825 *c*; rel. to Organic view of society, 309 *c*; compd. with Statical, 309 *b*.—Econ. sci., Inductive Meth., meth. of Agreement and Diff., 744 *d*, 745 *a*; Application, causes of diffic. of, 745 *d*, 746 *a*; J. E. CAIRNES on, 392 *a*; T. CARLYLE, 392 *c*; Classical Sch. and, 391 *c*, 392 *b*; compd. with Concrete, 391 *a*; compd. with Historical, 309 *b*; W. S. JEVONS on, 476 *ab*; determination of Laws, 745 *d*; undervalued by J. S. MILL, 391 *b*; Place in econ., 392 *b*; and Quantitative agreement or diff., 745 *c*.—Econ. sci., Logical meth., W. S. JEVONS, 475 *d*, 476 *a*, 637 *c*-638 *b*; J. S. MILL, 637 *d*-638 *b*; R. WHATELY, 637 *c*.—Econ. sci., Mathematical Meth., theory of Consumers' Rent, 712 *b*; A. A. COURNOT, 156 *c*, 712 *bc*; Differential calculus, 423 *cd*, 711 *b*; Equations, 711 *b*, 712 *a*; Functions, 167 *d*, 711 *a*; F. FUOCO, 169 *d*; H. H. GOSSEN, 231 *d*-233 *d*; Hypothesis, Approximative, 349 *a*; Hypothesis, Illustrative, 348 *d*; Indirect use of, 711 *d*; Integral calculus, 423 *b*; A. N. ISNARD, 460 *bc*; W. S. JEVONS, 476 *bc*; Least squares, 587 *cd*; compd. with Literary meth. of Classical Sch., 712 *a*; T. R. MALTHUS on, 711 *c*; and Monopoly, 712 *bc*; calculus of Variations, 711 *b*.—Econ. sci., Narrative meth., and History, 742 *d*, 743 *ab*; and Statistics, 743 *a*.—Econ. sci., Synthetic Meth., compd. with Analytical, 744 *bc*, 877 *ab*.
Economy: Natural compd. with moneyed, B. HILDEBRAND on, 504 *cd*; transition from Natural to moneyed, S. JOHNSON on, 485 *b*; Rural, L. G. L. G. de LAVERGNE on, 575 *d*.
Education: Agricultural, U.K., 397 *b*; U.S.A. syst., 397 *d*.—Commercial, Austria, 888 *cd*; Germany, 875 *d*; Italy, 857 *b*.—Industrial Education, Eng., recent efforts at Improvement, 396 *c*; Private enterprise, 397 *ab*; School boards, 396 *d*; Secondary technical schools, 396 *d*; U.S.A., 397 *d*.—Education, National, 243 *a*, 538 *c*; Sir J. P. KAY-SHUTTLEWORTH, 502 *d*.
ELIOT, F. P., on Ideal money: 353 *b*, 793 *d*.
Emblements, or Growing crops: 268 *a*.
Emigration: J. HILL-BURTON on, 307 *d*; and Immigration, 355 *c*.
Eminent Domain: Roman Law, 545 *c*.
Emphyteusis, tenure of land in Roman law: 1 *b*, 546 *b*, 563 *b*.

Employers: compd. with Capitalists, 516 *d*; Importance of, in mod. industry, 517 *a*; Industry, captains of, 402 *bc*; legal rel. to Labourer, 523 *b*-525 *b*, 538 *a*; F. A. WALKER on, 516 *d*.

Employment: Irregularity of Employment, Causes of, 458 *c*; Dock Labour, 458 *d*; Remedies for, 459 *a*; and problem of Unemployed, 458 *b*.

Enclosures: Arable land, conversion to pasture, 320 *c*; Effects, 686 *d*, 687 *a*; J. HOWLETT on, 335 *a*; Progress, 18th centy., 321 *b*.

English Sch. of P.E.: closely conn. with Ger. Sch., 205 *c*.

Entail: Eng. syst., 49 *a*, 546 *a*; Minorat, Ger., 770 *c*.—Entail, Majorat, Fr., 664 *a*; Objections to, 664 *c*; Prussia, 664 *b*.—Entail, Objections to, as restricting Transfer, 49 *b*.

Entrepreneur: or Employer, 691 *cd*; and Luck or Conjunctur, 648 *b*.—Entrepreneur, Functions of, in Distribution; F. A. WALKER on, 516 *d*.

Ephémérides: Laissez-faire in, 534 *d*.—Ephémérides, Articles by V. R. de MIRABEAU, 777 *c*.

Equilibrium: and W. S. JEVONS' Mechanics of Industry, 720 *c*.—Equilibrium of Supply and Demand, and Int., rate of, 428 *b*.

Equity, American Society of: 847 *c*-848 *a*, 852 *c*.

Evolution: J. G. FICHTE and G. W. F. HEGEL on, 502 *b*; G. KANT on, 502 *b*; Social, econ. rel. of to scientific meth., 743 *bc*.—Evolution, Econ., and T. E. Cliffe LESLIE, 313 *bc*, 597 *b*.

Exchange: Bimetallic ratio of, and Monetary Conference of Paris 1878, 785 *bc*; Dry, euphemism for usury, 431 *d*; H. H. GOSSEN on, 233 *a*; W. S. JEVONS on, 477 *cd*; J. du MESNIL MARIGNY on, 736 *d*; James MILL on, 755 *b*; T. MILLES on, 764 *c*; Money as common medium of, 789 *ab*, 791 *c*-793 *a*.—Exchange, Royal, founded by Sir T. GRESHAM, 262 *b*.—Under Monopoly: One-sided, 806 *ab*; Two-sided, 806 *b*.

Exchequer: Early hist. of, T. MADOX on, 662 *b*.—Exchequer Bill, Hist. of, 275 *ab*.—Exchequer, Medvl., Justices of the Jews, 481 *d*.

Excise: Gauger, 187 *d*.

Expenditure: Productive and unproductive, 228 *bc*, 654 *bc*.

Experience, importance of, R. JONES on: 490 *b*.

Experimental Meth., use of in Econ. sci., 391 *d*.

Exports: Free, general practice respecting, 370 *c*.—Exports, Duties on, Origin of, 367 *a*.—Exports, Restraint on, Contraband, 371 *a*; mod. Eur. countries, 370 *d*; Precious metals, Merc. Syst., 370 *d*; Wool trade, Eng., 370 *d*.

F's, The Three, meaning of term: 1 *a*.

FABBRONI, G., on Customs Duties and Free Trade: 3 *ab*.

Fabian Society: and employment, 923 *c*.

Factories, as syst. of Colonisation: 3 *d*.

Factory: labourer in, P. GASKELL on, 186 *c*; dist. fr. Mill, 754 *d*; Statutory conception of, 6 *bc*, 7 *a*, 9 *abc*; dist. fr. Workshop, 7 *bc*, 9 *abc*.—Factory Acts, 11 *b*, 845 *a*-846 *b*; H. FAWCETT on, 42 *c*; Hist. and effects, 4 *d*-8 *c*, 242 *c*, 243 *a*; and Hours of Labour, 333 *d*, 585 *d*, 845 *a*-846 *b*, 914 *c*-915 *d*; International legislation, 8 *ab*, 846 *ab*, 915 *abc*; W. S. JEVONS on, 477 *a*; and Manchester Sch., 679 *d*; and rel. of Master and Servant, 710 *a*; R. OASTLER, 333 *d*; and Restrns. on Labour, 5 *cd*, 400 *d*, 524 *d*, 845 *a*; U.S.A., 8 *cd*, 540 *c*, 845 *d*; war-time legislation, 8 *a*.—Factory Syst., Econ. effects, 10 *d*, 11 *ab*, 518 *b*; Moral and physical effects, 10 *bc*, 11 *a*; Rise of, 10 *a*.

Fairs: dist. fr. Markets, 13 *b*-14 *a*, 696 *a*; Medvl., functions of, 14 *bc*, 721 *abc*.

Fallacies, econ.: Illustn. of, 17 *bcd*; J. S. MILL on, 17 *b*.

Famine: Conditions of, 19 *bc*, 20 *a*-21 *a*; and price of Corn, 21 *ab*; Depopulation as symptom of, 21 *d*; Fr., 18th centy., 19 *d*, 20 *a*; Ind., 20 *b*; A. SMITH on, 19 *d*.—Famine, Remedies for, Artificial, 22 *c*; Natural, 22 *ab*.

Farm Bureau Federation: 850 *a*-853 *ac*.

Farmers' Alliance: 26 *a*-27 *c*, 846 *b*-847 *c*.

Farmers' Educational and Co-operative Union: 848 *abcd*, 852 *c*.

Farmers' Organisations, U.S.A.: 23 *c*-27 *d*, 846 *c*-854 *b*; Co-operation in, 847 *bc*, 848 *cd*, 849 *c*, 850 *d*, 851 *bc*; Political infl. of, 25 *bc*; and Amern. Railways syst., 24 *b*, 25 *bc*, 26 *b*, 846 *d*, 849 *a*; and Silver, coinage of, 25 *c*, 846 *c*; and Taxation, 25 *d*, 846 *d*, 849 *c*.

Farming syst.: Allotment and subdivision, 30 *bc*; and Depression, agricultural, 30 *ab*; Description and effects, 29 *bcd*; in Eng. and Scot., rise of, 28 *b*-29 *a*; Future of, 31 *d*; Lease and agreement, 30 *d*; Legisl. on, 31 *cd*; Rent, 31 *a*; State regulation of, war-time, 868 *cd*.

FARR, W.: and Census, 701 *b*; and Centralisation, 34 *b*; and Life tables, calcul. of, and vital statistics, 34 *ab*; and Mean afterlife-time, 718 *c*.

Fashion: effects of Fluctuation, 37 *c*; in Prodn. and Distr., and trade risk, 36 *d*-37 *b*; effects on Wage-earner, 37 *d*-38 *a*.—Fashion in Consumption, G. BERKELEY on, 35 *d*; Limitations to, 36 *b*; J. LOCKE on, 36 *c*; affecting Qual. and Quant. of goods, 36 *a*; affecting Rapidity of consumption, 36 *b*; J. B. SAY on, 35 *d*, 36 *b*.

Fathers: on Charity, 38 *c*, 39 *ab*.—Fathers, post-Constantinian, on Int. and Usury, 39 *c*; Property, 39 *a*; Slavery, 39 *b*; Trade, 39 *c*.

FAWCETT, H.: on Factory Acts, 42 *c*; Indian Finances, 42 *ab*; Income-tax, differential, 377 *d*; Intrinsic Value, 455 *d*, 456 *a*; Pauperism, 42 *d*; Socialism, 42 *d*.

Federation, commercial, in Brit. Empire: Objects of, 45 *b*; Prospects, 48 *a*.—Proposals: by inter-Imperial Free Trade, 46 *a*; Mr. Hoffmeyer's, 47 *c*; by Preferential tariff, 46 *d*.

Females and Children, Earnings of: previous to Factory syst., 50 *cd*; from 1906 to present day, 855 *a*-856 *d*; in Field Labour, 51 *d*; Statistics of, 1832, 51 *bc*.

FERGUSON, A.: similarity of views to A. SMITH's,

53 *a*; and **Sociology**, 53 *cd*; on Taxation, 53 *b*.

Feudalism: development of, in Anglo-Saxon period, 509 *b*; Char. of, 54 *cd*, 543 *b*, 545 *d*; struggle of medvl. **City** with, 55 *b*, 140 *b*, 830 *b*; N. D. FUSTEL DE COULANGES on, 171 *bc*; **Honour** and manorial syst., 330 *ab*; and **Taxation**, 55 *a*.—Feudal Incidents, **Aid**, 137 *d*, 510 *d*; **Escheat**, 511 *b*; **Fine**, 82 *a*, 511 *a*; **Marriage**, 138 *a*, 511 *a*, 692 *d*, 700 *cd*; **Primer seisin**, 511 *a*; **Relief**, 137 *d*, 511 *a*; **Wards**, 138 *a*; 511 *a*, 700 *d*.

FICHTE, J. G., on **Development**: 55 *d*, 502 *b*.

FILANGIERI, G., link between **Merc. Syst.** and **Free Trade**: 59 *c*.

Final Degree of Utility: **Austrian Sch.** on, 61 *a*, 876 *d*; illustr. by **Curves**, 60 *abcd*; **Ger. Sch.** on, 876 *d*; H. H. GOSSEN on, 233 *a*; **Ital. Sch.** on, 909 *a*; W. S. JEVONS on, 59 *d*, 60 *d*.

Finances: and **Cameralistic Sci.**, 62 *b*, 196 *cd*; K. von HOCK on, 316 *d*; Indian, H. FAWCETT on, 42 *ab*; J. H. G. von JUSTI on, 500 *a*; conception of by **Merc. Sch.**, 62 *a*; and **P.E.**, 62 *b*; and public **Property**, 62 *d*; Roman, fiscus, 85 *bc*; A. PALGRAVE'S DICTIONARY

OF

POLITICAL ECONOMY

EDITED BY

HENRY HIGGS, C.B.

SOME PRESS OPINIONS OF THE EARLIER EDITION.

ECONOMIC JOURNAL.—"Its value is manifest; ample and trustworthy information, abundance of verified documents, bibliography of inappreciable value, it must be the *vade mecum* of him who wishes more knowledge."

STATIST.—"An excellent cyclopædia of all matters pertaining to political economy."

STANDARD.—"A financial work of more than ordinary importance. . . . The information has been well brought up to date. . . . Equally valuable to the student of finance or political economy and to the business community."

OBSERVER.—"Mr. Palgrave's extremely valuable work."

SCOTSMAN.—"Mr. Palgrave is to be congratulated on having brought together a vast amount of valuable material and arranged it in a fashion in which it will be readily accessible."
